NATIONAL SUMMARY

JANUARY 1969

Volume 20 No. 1

Asheville 1969

CONTENTS

NOTE: Delayed data and corrections will be carried in the June and December issues of this publication. An explanatory page "Description of Charts" will be carried in the January and July issues.

SUBSCRIPTION PRICE: Monthly 20 cents and annual 40 cents per copy; yearly subscription, including monthly and annual issues, $2.50 domestic, $3.50 foreign. Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to "Superintendent of Documents, Government Printing Office, Washington, D.C. 20402"

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 20 No. 1 JANUARY 1969

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Record or near-record snow in the Pacific Northwest closed roads and crushed many buildings.
2. Heavy rains in California caused flooding and damaging mudslides.
3. Heavy snow from the northern Great Plains to the Northeast closed roads; glaze south of the snow area made travel hazardous.
4. Bitter cold continued in Montana where January temperatures over large areas averaged 5° below zero--22° below normal.

TEMPERATURE.--January temperatures averaged above normal over the Great Basin, the central and southern Rocky Mountains, and the southern Great Plains. Some of those areas averaged 6° to 8° warmer than normal. Northern New England and southern Florida averaged slightly warmer than normal. Most of the eastern half of the United States averaged 2° to 7° cooler than normal. The intensely cold area extended from eastern Washington across northern Idaho and Montana to North Dakota. Most of this area averaged at least 10° colder than normal.

Cold weather persisted over a large area from the Pacific Northwest to the northern Great Plains throughout almost the entire month. The cold was especially intense in northern Montana where temperatures at Great Falls remained continuously below zero for almost 2 weeks and at Havre which endured below-zero weather for 380 consecutive hours. Northern and eastern Montana experienced the coldest January in almost 2 decades. The temperature at Havre plunged to 52° below zero on the morning of the 24th and could climb to only -29° in the warmest part of the afternoon. Havre's minimum of -52° on the 24th was the coldest temperature at that station in more than half a century. Billings registered subzero temperatures every morning from the 19th to the 30th--the longest period with daily subzero minimums in 75 years.

An especially cold arctic air outbreak spread over most of Washington on the 27th, accompanied by northerly and northeasterly winds. Temperatures fell rapidly for several days. At numerous locations the minimums on the 27th were the maximums on the 28th. The coldest temperatures in the area occurred mostly on the 30th. Minimums in western Washington ranged downward to -25° on the 31st at Stevens Pass and in eastern Washington to -48° at Mazama on the 30th. The Great Basin remained warm until the last few days of the month. Cool weather predominated over most of the East during the first half of the month, but warmer weather prevailed in the last half. Florida warmed sufficiently in the last 2 weeks of January to average near normal in the north and slightly above normal in the south.

January 1969 was the coldest January in the recorded history of weather in southeast Alaska. All except the extreme southern end of the Panhandle set new alltime records for the coldest January on record. It was not a matter of extreme cold, but one of prolonged cold. Sitka with 84 years of record was 2° colder than the previous January record of 18.4°F. Because of the cold, all precipitation was in the form of snow, and extra heavy amounts did occur. However, water equivalents fell far below normal. Normal sources of water were cut off because water and sewer pipes became frozen. Water was distributed by tank trucks or in barrels. Fire hazards increased because of no water. No damage reports have been issued, but contending with the problem was costly.

PRECIPITATION.--Daily rains continued along the Washington-Oregon coast with recordbreaking snow accumulations in the Cascades. The runoff from melting snow and heavy rains sent several rivers in western Washington near or above flood stage early in the month. Mudslides damaged residences, highways, railroads, and other property. In Oregon, the heavy snows and freezing rain made travel hazardous--in some ares impossible. Heavy snow from the Pacific coast to the Blue Mountains on the weekend of January 11 and 12 closed roads and schools on the 13th. Buildings were crushed by the weight of the snow and snow-laden trees fell across powerlines knocking them down. Heavy precipitation continued in the Far West in the latter half of January. Heavy snow fell in Washington and Oregon. Snowslides blocked highways and halted traffic. Hundreds of buildings in Oregon collapsed under the weight of the snow, destroying or extensively damaging the buildings and their contents. Thousands of persons were without telephone or power service for several days while lines were being repaired. In California, heavy rains in the last half of January caused considerable loss of life besides millions of dollars property damage. At least 20 persons were drowned and 16 were buried in mudslides. Mudslides closed highways and railroads, and rising streams forced thousands of persons from their homes.

A variety of severe weather occurred over the northern Great Plains in January. Record or near-record snowfall occurred in parts of Montana. Icy roads and blizzards closed some schools for a day or so early in the second week and many schools in the last week of the month. In South Dakota, the snow, often accompanied by strong winds, and the freezing rain hampered traffic. Many schools remained closed for a day or so and social activities were postponed. Blizzards, deep drifts, and icy highways closed many roads and schools in Minnesota, Michigan, and Indiana near the end of the first week of January.

Frequent snow squalls occurred in the Northeast early in January. New York's Snowbelt received 25 to 50 inches from January 1 to 11. The snowfall ranged up to 75 inches at Mallory. Strong winds--gusting to 82 m.p.h. at Blue Hill Observatory, Milton, Mass.,--drifted the snow badly in much of the Northeast. Highways became clogged and many motorists became stranded. The strong winds in Massachusetts damaged trees and signs, broke windows, and blew down powerlines disrupting power and communications. A prolonged period of freezing rain iced almost the entire area from New York, Pennsylvania, and Virginia northeastward to Maine. Traffic slowed, walking became difficult, and hundreds of persons injured themselves in falls.

Generous rains began in the Deep South and spread northward on the 20th and 21st. Widespread thunderstorms, including a tornado, killed 32 persons and

injured 241 others besides causing extensive property damage in Mississippi on the 23d.

Numerous locations in the West and the northern and central Great Plains received record or near-record precipitation in January; however, only light sprinkles or snow flurries occurred on the eastern slopes of the Rockies and along the western edge of the Great Plains. Columbus, Ga., received only 1.22 inches during the month, the 2d lowest January amount in their 23-year record.

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

V Sun below horizon January 1-23, inclusive.
X Sun below horizon January 1-17, inclusive.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

V Sun below horizon January 1-23, inclusive.
X Sun below horizon January 1-17, inclusive.

H Hundreds
C Crop damage
° Includes crop damage

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
# Freezing drizzle and freezing rain, commonly known as glaze.
∅ For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, ESSA, monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000
7 $5,000,000 to $50,000,000
8 $50,000,000 to $500,000,000
9 $500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

JANUARY 1969

Elmer R. Nelson, Office of Hydrology

The most damaging floods during January occurred in southern California. These floods were generally the most severe since 1938. The flooding on the Salinas River was the most severe since 1952. Major damages occurred on the Chouchilla and Fresno Rivers and along streams running into the valley from the foothill areas. Property damage from flooding and mudslides were estimated at about $170 million. The American Red Cross reported that a total of 47 lives were lost in California during January due to floods, mudslides, and snowstorms.

Lake Michigan.--Heavy snowmelt caused minor flooding on the Red Cedar River at Williamston, Mich., on the 23d and 24th. Near flood conditions occurred at East Lansing, Mich., on the 24th and 25th, and again on the 30th and 31st. Unseasonably warm temperatures in the high 40's on the 21st-24th caused complete melting of most of the snow cover in southern Lower Michigan and heavy runoff. Timely arrival of cold weather early on the 24th with an abrupt 40° temperature drop in 18 hours to near zero during the next few days ended temporarily the threat of further flooding. No damage resulted from the minor flooding.

Heavy snowmelt on the 16-24th over the Grand River Basin in Michigan produced sufficient runoff to raise the Lower Grand River to near flood stage in some localities. Comstock Park, just north of Grand Rapids, Mich., reached but did not exceed flood stage on the 26th. Minor lowland flooding was observed. Minor lowland flooding occurred in Robinson Township of Ottawa County, Mich., through the end of the month. This flooding was due to an icejam that reached the bottom of the channel during the last few days of the month.

ST. LAWRENCE DRAINAGE

Lake Erie.--The St. Marys River at Decatur, Ind., rose above flood stage on the 18th and continued in flood to Feb. 5. The crest on the 31st was 5.4 feet above flood stage. The St. Joseph River at Montpelier, Ohio, was out of its banks from Jan. 19 to Feb. 6. It crested on the 31st, 4.7 feet above flood stage. The Maumee River at Napoleon, Ohio, rose rapidly to 8.9 feet above flood stage on the 29th. This rapid rise was due to an icejam at the eastern end of the city. About 25 families were evacuated. The icejam broke shortly after 5 p.m. on the 29th, and the river receded at the rate of 1.5 feet in 10 minutes. The Maumee River rose above flood stage at Ft. Wayne, Ind., Defiance and Grand Rapids, Ohio, on the 30th. It receded within its banks on Feb. 1-5. The crests ranged from 3.3 feet above flood stage at Grand Rapids, Ohio, to 6.2 feet above flood stage at Fort Wayne, Ind.

Heavy rains during the last 2 days of the month caused flooding of some roads and cellars in southwestern New York. Amherst and Cheektowaga, N. Y., had the heaviest cellar flooding. Minor overflows occurred in the Sunset Bay area of Chautauqua, N. Y., due to ice jamming at the mouth of Cattaraugus Creek. Scattered flooding of highways was reported in parts of Genesee and southern Chautauqua counties. In southwest Batavia in Genesee County, N. Y., Tonawanda Creek overflowed its banks in a small area.

ATLANTIC SLOPE DRAINAGE

The Susquehanna River at Vestal, N. Y., reached a stage of 18 to 19 feet (flood stage 18 feet) on the 31st due to an icejam about 1,000 feet below the gage at a bend in the river. It receded within its banks on Feb. 1. No damage resulted.

Significant ice movement and jamming on the 30th and 31st resulted in some minor low-level flooding on the Susquehanna River in Pennsylvania. This rise was due to rainfall and mild temperatures supplemented by snowmelt. Snow cover remaining within the basin at the end of January was limited to the higher elevations in the headwaters of the West Branch above Renovo, Pa., and in the upper Delaware River basin in the Pocono Mountain area.

The Neuse River at Smithfield, N. C., exceeded flood stage on the 23d-25th. The crest on the 24th was 0.6 foot above flood stage. This flooding was due to heavy precipitation on the 19th and 26th.

The Lumber River at Lumberton, N. C., exceeded flood stage for the 4th consecutive month. There were two rises during January. The first rise on the 1st-12th was due to moderate rains during the last few days of December. The second rise, to above flood stage on the 23d and continuing into February, was due to heavy precipitation on the 19-20th. Low swamps and drainage ditches were affected.

The Saluda River at Chappells, S. C. exceeded flood stage on the 20th-23d. The crest on the 21st was 2.7 feet above flood stage. The Broad River at Blair, S. C., was out of its banks on the 21st to the 23d. It crested on the 22d, 3.3 feet above flood stage. This flooding was due to heavy rains (1.5 to over 3 inches) over the upper and central reaches of the basin on the 19-20th. Damage was limited to pastureland with no actual damage occurring.

The Savannah River at Clyo, Ga., rose above flood stage on the 29th and continued in flood with rising stages into February. Very little, if any, damage resulted from the flooding during January.

The Oconee River at Milledgeville, Ga., was out of its banks on the 23d-25th. The crest on the 23d was 4.4 feet above flood stage.

EAST GULF OF MEXICO DRAINAGE

The Cahaba River at Centreville, Ala., exceeded flood stage on the 20th-21st. The crest on the 20th was 4.1 feet above flood stage. The stream rose rapidly due to local rainfall of 4.27 inches on the 19-20th. Damages from the overflow were negligible.

Moderate to occasionally heavy rains on the 18th and 19th caused moderate rises on the Black Warrior River in Alabama. The only crest above flood stage was at Warrior Lock and Dam, Ala., which was 0.4 foot above flood stage on the 23d. No damage was reported.

Heavy rains (3 to 4 inches) over the headwaters of the Pearl River on Dec. 18-22 caused flooding at Jackson, Miss., on Dec. 24 to Jan. 7 and at Bogalusa, La., on Dec. 23 to Jan. 11. Overflow began at Pearl River, La., on Jan. 3 and continued to Jan. 6. Flood heights were not excessive and flooding was confined to the immediate flood plain with only light damage to farms and cattle lands. The highest crest reported was 5.8 feet above flood stage at Jackson, Miss., on Jan. 1. Rainfall of near 1.5 inches on Dec. 27-30 produced secondary crests during January which were lower at Bogalusa and Pearl River than during December.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--Precipitation during January in the Upper Mississippi Basin ranged from

normal to much above normal. In Minnesota and northwestern Wisconsin, precipitation was 3 times normal in many locations. In the Minneapolis-St. Paul, Minn., area, the January total snowfall of 21.6 inches (liquid water content, 2.05 inches) was the 4th greatest January snowfall of record. The total season snowfall through Jan. 31 was 55.2 inches. This was the greatest snowfall for any season through Jan. 31. Previous record was 51.6 inches during 1966-1967 and the 3d most snowfall was 46.8 inches during the 1916-1917 season. Normal snowfall through Jan. 31 is 20.8 inches.

At Duluth, Minn., the total snowfall during January was 46.8 inches (4.70 inches, liquid water content). This monthly total exceeded the record fall for any month during the winter season. Previous record was 45.5 inches established March 1965. By the end of January the total snowfall at Duluth was 106.3 inches. This is the most snowfall on record for so early in the season.

At Sioux Falls, S. Dak., the total snowfall during January was 19.6 inches (liquid water content, 1.71 inches). The total seasonal snowfall through Jan. 31 was 63.3 inches (liquid water content, 4.75 inches). Normal snowfall through Jan. 31 is 15.9 inches.

The Wapsipinicon River at DeWitt, Iowa, was in light flood on the 24th and 25th. The crest on the 24th was 1.3 feet above flood stage. The Pecatonica River was out of its banks at Martintown, Wis., on the 24-26th and at Freeport, Ill., on the 25th. The crest at Martintown was 2.6 feet above flood stage on the 24th and 0.2 foot above flood stage at Freeport, Ill., on the 25th. The Rock River at Joslin, Ill., was out of its banks on the 25-28th. This flooding was due to 0.5 to 1 inch of rain on frozen ground and some melting of snow cover on the 23d and 24th. There was very little ice movement. Pastures and farmland were principally involved and damage was negligible.

Locally heavy rains toward the end of December produced minor flooding on the Meramec River in Missouri from Dec. 29 through January 1. The flooding was limited to farmland immediately adjacent to the river and no damage was reported.

Light to moderate rains on the 16th, 17th, 22d, and 23d produced minor flooding along the Fox, Illinois, and Sangamon Rivers in Illinois and on the Fox River in Missouri. The Fox River crested 1 foot above flood stage at Wayland, Mo., on the 17th. In Illinois, the Fox River at Dayton went above flood stage on the 24th and continued above flood stage to Feb. 8. The Sangamon River at Riverton, Ill., crested 2.5 feet above flood stage on the 19th with a secondary crest, 5.8 feet above flood stage on the 23d. Crests during February were slightly lower. The Illinois River at LaSalle, Ill., crested 0.9 foot above flood stage on the 24th with a secondary crest 1.3 feet above flood stage on the 31st. The Kankakee River at Momence, Ill., crested 0.6 foot above flood stage on the 22d. It reached bankfull stage again on the 29th. The Spoon River at Seville, Ill., rose 1.5 feet above flood stage on the 26th. It was out of its banks on the 25th and 26th.

General rain and/or snow began falling over Missouri and Illinois on the 26th and continued through the 29th. The rain became quite heavy on the 28th and 29th. Excessive runoff resulted due to the nearly saturated or frozen condition of the soil at the onset of the precipitation. Major flooding resulted on the Meramec and Big Rivers in Missouri. The Meramec River at Steelville and Sullivan, Mo., crested 11 to nearly 12 feet above flood stage on the 30th. At Pacific, Eureka, and Valley Park, Mo., the Meramec rose above flood stage on the 30th and continued in flood to Feb. 3. The Big River at Byrnsville, Mo., went above flood stage on the 30th and continued in flood to Feb. 1. The Bourbeuse River at Union, Mo., rose 4.3 feet above flood stage on Feb. 1. Major flooding developed on the Kaskaskia and Big Muddy Rivers in Illinois during the latter part of January and the first week in February. The Kaskaskia River at Shelbyville and Vandalia, Ill., rose above flood stage on the 29th and continued in flood to Feb. 6 at Vandalia, Ill. The crests on Jan. 31 ranged from 3.2 feet above flood stage at Shelbyville to 7 feet above flood stage at Vandalia. The Big Muddy River at Murphysboro, Ill., continued in flood to Feb. 17. The crest on Feb. 3 was 16 feet above flood stage. Snowmelt contributed to the overall runoff, but was not a major factor in the areas where substantial flooding occurred.

Some flooding occurred along the main stem of the Mississippi River below the mouth of the Fox River in Missouri. The Mississippi River was out of its banks at Gregory Landing, Mo., on the 25-27th. The crest on the 27th was 0.7 foot above flood stage.

Missouri Basin.--Some minor flooding occurred on the Yellowstone River near Reedpoint, Mont., during January. The overflow was due to icejams.

Temperatures were cold in the South Dakota portion of the Missouri Basin, excpet in the extreme western portion, during the first half of the month. Most streams in South Dakota and northern Nebraska remained frozen over except the Missouri River in northeastern Nebraska. Precipitation for January was generally above normal except in western South Dakota and eastern Wyoming.

Snow depths at the end of January ranged from 11 to 26 inches in eastern South Dakota to little or none in western South Dakota and eastern Wyoming. The liquid water content of the snowpack in eastern South Dakota ranged from 2 to 6 inches. In northeastern Nebraska, the snow depths ranged from 6 to 10 inches with a liquid water content of 1.5 to nearly 3 inches. Snow depths in southwestern Nebraska and extreme north-central Kansas were mostly 2 to 4 inches and over northeastern and east-central Kansas, 3 to 6 inches. In the Blue River basin in Kansas, the snow dpeths were generally 6 inches to locally over 12 inches in the Blue River basin.

Frost depths in South Dakota were generally less than 1 foot under the snow to several feet in unprotected areas in northwest Iowa at the end of January.

Minor flooding occurred in the northwestern quadrant of Missouri during the latter half of January. The Grand River at Sumner, Mo., was out of its banks on the 17th-22d. The crest on the 17th was nearly 7 feet above flood stage. The crest on Moniteau Creek at Fayette, Mo., was estimated to range from bankfull stage to 1 foot above flood stage. The Lamine River at Clifton City, Mo., rose 0.2 foot above flood stage on the 30th. The Petite Saline River at Boonville, Mo., was estimated to have risen 2 feet above flood stage on the 30th-31st.

The Osage River at Lakeside, Mo., crested at bankfull stage on Jan. 1. It rose slightly above bankfull stage at Schell City, Mo., on the 19th. Considerable flooding occurred along the Gasconade River with a crest 3.9 feet above flood stage at Hazelgreen, Mo., on the 31st. At Jerome, Mo., the Gasconade River rose above flood stage on the 30th and continued in flood to Feb. 2. The crest on Feb. 1 was 6.5 feet above flood stage.

Icejam flooding occurred on the upper Missouri River in a 12-mile stretch about 40 miles south of Great Falls, Mont., from the 22d through the end of the month.

About 2 feet of flood water covered U. S. Highway 91 and Interstate Highway 15 between Great Falls and Helena, Mont. Highway crews were not able to reopen the route through the end of the month. Three to 4 inches of water flooded the tracks of the Great Northern Railroad but did not cause any excessive delay in train schedules. Large areas of bottomlands were flooded along with some farmlands, but damage to dwellings and property was not extensive. The major contributor to the flooding was the extremely cold temperatures during the latter half of January. Temperatures in the Cascade area were below zero from the 17th through the 31st, with readings 40° to 50° below zero periodically. Minor damage resulted to a foot bridge and a ferry which was swept downstream as the ice broke loose. The only other flooding along the main stem occurred at Rulo, Nebr., on the 18th to the 23d. The crest on the 18th-21st was 0.4 foot above flood stage.

Ohio Basin.--French Creek at Meadville, Pa., exceeded flood stage by 0.7 foot on Jan. 31 to Feb. 1. This overflow was due to rainfall totalling near 2 inches on the 28-30th plus snowmelt.

Average daily temperatures below 32°F. from Dec. 29 through Jan. 16 resulted in heavy ice formations on the Allegheny River in the East Brady, Pa., to Emlenton, Pa., reach and in the vicinity of Oil City, Pa. A warming trend on the 17th, accompanied by light rain on the 17th and 18th, plus snowmelt resulted in sufficient streamflow to move the 20-mile long ice gorge in the East Brady-Emlenton, Pa., reach. With the movement of ice, backwater at Parker, Pa., caused a stage of 2.8 feet above flood stage on the 19th. Minor flooding occurred to cottages in the East Brady, Pa., area as the ice moved out. The ice gorge at Oil City, Pa., moved out on the 18th with no backwater flooding. Flood damages at Parker, Pa., were minor. The main highway through the city was closed for a short period.

The Hocking River at Enterprise, Ohio, exceeded flood stage on the 30th and 31st. The crest on the 31st was 0.5 foot above flood stage. Flood damage was minor.

Paint Creek at Bourneville, Ohio, reached, but did not exceed, flood stage on the 31st. The Scioto River at LaRue, Ohio, reached flood stage on the 19th. It exceeded flood stage again on the 30th at LaRue, Circleville and Picketon, Ohio, and on Feb. 1 at Prospect, Ohio. This flooding was due to moderate to heavy rains on the 29th and 30th. It crested at LaRue, Ohio, on the 31st, 0.9 foot above flood stage. Crests at the other points occurred on Feb. 1-2 and ranged from 1 to 4 feet above flood stage.

Flooding was confined to farmlands presently not in production. Several secondary roads were under water for 24 to 36 hours. A few families living in the flood plain of Big Walnut Creek were evacuated for the night of the 30th and returned to their homes on the afternoon of the 31st.

Prolonged cold weather and snow cover during the first 2 weeks of January set the stage for a major flood in the Wabash Basin in Indiana during the latter part of January and early February. This cold weather caused ice to cover most streams up to 1 foot thick by the middle of the month. Heavy rainfall (up to 5 inches) over the lower Wabash and lower White Rivers resulted in heavy runoff with crests in February the highest in 10 years at Lafayette, Ind., and the highest since March 1913 at Mt. Carmel, Ill. A few homes were surrounded in rural areas near Lafayette, but few, if any, evacuations were necessary. Flooding began along the White, the East Fork, the Muscatatuck Rivers in Indiana and on the Embarrass and Vermillion Rivers in Illinois during the last 3 days of January. On the White River above Noblesville, Ind., homes in one or two small communities were surrounded by water and some damage resulted downstream at Spencer, Ind.; a few families were temporarily evacuated from a low area, subject to flooding. At Elliston, Ind., the Milwaukee Railroad made preparations for emergency routing of trains. Flooding on all of the streams contributed to the overflow of thousands of acres of bottomland. Many county and state roads were temporarily closed. Some culverts were washed out. A few secondary roads were damaged by washouts. Crop damage was at a minimum since most of the corn had been removed from the bottomlands.

Heavy rains on the 17th and 18th caused moderate flooding on the Saline River at Harrisburg, Ill., on the 17th to the 21st. The crest on the 19th was 7.9 feet above flood stage. Heavy rain during the last 5 days of the month caused additional flooding on the Saline River at Harrisburg from the 28th to Feb. 3. The crest on the 31st was 11.2 feet above flood stage. These rains caused near record crests on the lower Wabash and Little Wabash Rivers in southern Indiana and southern Illinois. Precipitation in the Rough and Green River basins in Kentucky was light so consequently only minor flooding occurred along those streams.

The main stem of the Tennessee River rose above flood stage at Paducah, Ky., on the 30th and continued in flood to Feb 18. The crest on Feb. 10 was 10.9 feet above flood stage.

The main stem of the Ohio River rose out of its banks at Fords Ferry, Ky., on the 30th and at Newburgh, Ind., Shawneetown, Ill., and Cairo, Ill., on the 31st. By Feb. 5, flooding was in progress from Newburgh, Ind., to Cairo, Ill., (except at Evansville, Ind.,) a distance of more than 200 miles. The crests on Feb. 2-12 ranged from 1 foot above flood stage at Cypress, Ind., to 11.2 feet above flood stage at Fords Ferry, Ky. Flooding continued until Feb. 19 at Cairo, Ill.

White Basin.--Three- to 4-inch rains on Dec. 21-22 caused flooding on the Cache River at Patterson, Ark., on Dec. 23. Additional 3- to 4-inch rains on Dec. 27-28 caused flooding on the lower Black and White Rivers in Arkansas. Flooding continued along these rivers into January. The White River receded within its banks at Newport and Augusta, Ark., on Jan. 1-5 and on the Black River at Pocahontas and Black Rock, Ark., on Jan 8-12. The Cache River at Patterson, Ark., continued in flood from Dec. 23 through January into February.

Heavy rain on the 18-19th and 22-23d caused additional flooding on the lower White and Black Rivers. These rains were sufficient to keep streams above flood stage into February. Heavy rain on the 29-30th caused extensive flash flooding in the Buffalo, White, and Black River basins during the night of the 29th and the morning of the 30th. The most dramatic rise was 31 feet in a 13-hour period on the Buffalo River at Gilbert, Ark. The White River at Batesville, Ark., rose 14.4 feet in 24 hours. Seven persons were drowned in 5 separate accidents when cars in which they were riding were swept off highways by the flood waters. A great many cows were drowned by the rapidly rising flood waters. Damage to highways and bridges was heavy. Crop damages, although heavy, were mostly to pasturelands.

Arkansas Basin.--The heavy rain on the 29-30th

caused flooding on the Elk, Illinois, and Poteau Rivers in extreme southwestern Missouri and in extreme eastern Oklahoma. The rainfall averaged 2.5 inches in the Illinois Basin and 1.5 inches in the Poteau and Elk River basin. The high antecedent soil moisture was favorable for heavy runoff. The Elk River crested 3.1 feet above flood stage at Tiff City, Mo., on the 30th. The Illinois River crested 8 to 9 feet above flood stage at Tahlequah and Watts, Okla. The Poteau River at Panama, Okla., was out of its banks on the 30th and 31st and crested 2.7 feet above flood stage on the 31st. At Poteau, Okla., the crest was about 4 feet below flood stage. No damages were reported from the lowland flooding.

Flash flooding occurred in the Arkansas Basin during the night of the 29th and the morning of the 30th. Fourche and Rock Creeks in Pulaski County, Ark., rose rapidly during the night of the 29-30th flooding many residences and businesses in southwestern and southern areas of Little Rock. The Mulberry River at Mulberry, Ark., crested 3 feet above flood stage on the 30th. The Petit Jean River crested 3 to 4 feet above flood stage at Booneville and Danville, Ark., on the 30th and 31st. Flooding was still in progress at Danville at the end of the month. The Fourche LaFave River at Houston, Ark., was out of its banks on the 1st-13th. The crest on the 6th was 6.2 feet above flood stage. It rose above flood stage again on the 30th and continued in flood into February.

The Arkansas River at Van Buren, Ark., reported an average monthly stage of 14.0 feet, 6.5 feet above the normal monthly stage of 7.5 feet. This is the second highest January average stage on record. The highest was 15.6 feet in 1932.

Red Basin.--The Sulphur River at Naples, Tex., was above flood stage in the beginning of January. It rose above flood stage on Dec. 25 and receded within its banks on the 2d. The crest was 3.7 feet above flood stage on Dec. 28.

Heavy rains beginning on the 29th over southeastern Oklahoma, northeastern Texas, and southwestern Arkansas resulted in rapid rises with flooding beginning on the Sulphur River at Hagansport, Tex., on the 30th. Some flooding occurred on the same date on the Blue, and Clear Boggy Rivers and on Glover Creek in southeastern Oklahoma. Overflows also began along streams in southwestern Arkansas which continued into February. Damages along the Rolling Fork and Cossatot in De Queen, Ark., were estimated at $305,000.

Extensive flash flooding occurred in the Ouachita, Caddo, and Saline River basins during the night of the 29th and the morning of the 30th. The Saline River at Benton, Ark., rose 19.7 feet in 24 hours to a crest 11 feet above flood stage on the 30th. The Ouachita River crested 14.1 feet above flood stage at Rockport, Ark., on the 30th and 11.5 feet above flood stage at Arkadelphia, Ark., on the 31st. The Caddo River at Glenwood, Ark., rose 7.2 feet above flood stage on the 30th. The Little Missouri River at Boughton, Ark., rose above flood stage, on the 31st. The flooding on the Little Missouri, Saline, and Ouachita Rivers continued into February. Damage to highways and bridges was heavy. Crop damages, though heavy, were mostly to pasturelands.

Lower Mississippi Basin.--The flooding on the St. Francis River in the beginning of the month was due to heavy rain (2.75 inches) on Dec. 26-28. The crest at Fisk, Mo., on Jan. 1 was 2.8 feet above flood stage. The crest reached St. Francis, Ark., on the 4th and was 1.8 feet above flood stage. It receded within its banks at Fisk on the 5th and at St. Francis, Ark., on the 9th. Heavy rainfall (2.65 inches) near the middle of the month caused sharp rises to above flood stage on the 18th. It crested on the 19th 1 foot above flood stage and receded within its banks on the 21st. It rose above flood stage again on the 23d and continued in flood until Feb. 20. Upstream at Fisk, Mo., it rose above flood stage on Jan. 29 and continued in flood to Feb. 16.

Minor flooding occurred on the Big Black River at Bovina, Miss., from Dec. 31 to Jan. 2. The crest on Dec. 31 was 0.3 foot above flood stage. Flood damage was light.

WEST GULF OF MEXICO DRAINAGE

Minor flooding occurred on the Calcasieu River at Hineston, La., on the 5th. The crest was 0.2 foot above flood stage. This overflow was due to light rains during the first week of January over a stream that was already at a high level.

Minor overflow occurred on the Sabine River at Deweyville, Tex., from Dec. 12 to Jan. 9. The crest was 0.4 foot above flood stage on Dec. 24-25. No damage was reported.

Levels at Lake Houston, Tex., on the San Jacinto River exceeded the spillway elevation from Dec. 1 through January and February. The crests during December and January were 0.8 and 0.25 foot above the spillway, respectively. The highest level occurred on Feb. 23 when it exceeded the spillway elevation by 2.2 feet.

GULF OF CALIFORNIA DRAINAGE

Colorado Basin.--Heavy rains in southern Utah during the last week of January caused some minor flooding, primarily along the Virgin River and its tributaries. Some damage resulted to a few farms in the Bunkerville, Nev., area. Alton, Utah, near the divide between Sevier and Virgin River basins, reported 9.15 inches of rain, over 5 times normal. Heavy rain was also reported in the Bull Valley Mountains south and west of Enterprise, Utah. Shoal Creek, near Enterprise, flooded about 2,000 acres, but the damage was negligible. There was some minor damage to roads.

Locally heavy rain on the 25th and 26th caused a rapid rise on Oak Creek, a tributary of the Verde River in Arizona to a high level but no overflow was reported. Verde River had a peak flow of 47,000 c.f.s. at noon on Jan. 26. The total flow into the Verde Dam System was the highest for any January with 144,401 acre-feet. The previous highest January flow was 138,000 acre-feet in 1952.

GREAT BASIN

Heavy rains during January caused sufficient rise in the Truckee River near Vista, Nev., (east of Reno) to cause some local overflow. Heavy runoff caused local drainage problems at Sparks, Nev. No damage was reported. Precipitation during January was more than 3 times normal at Reno, Nev., and Truckee, Calif. The snowpack at Norden, Nev., (near Donner Summit) was 175 inches on Jan. 31 compared to a 50-year average of 80 inches. The Soil Conservation Service reported the snowpack at Marlette Lake, between Carson City, Nev., and Lake Tahoe, to be the greatest of record.

PACIFIC SLOPE DRAINAGE

The most severe flood since 1938 occurred in southern California due to excessively heavy rain on the 18th through the 26th. The precipitation averaged from

10 to 15 inches in the lowlands and from 30 to 35 inches over mountain areas. The greatest amounts, in excess of 45 inches, occurred at Opid's Camp and at Mt. Baldy, both in the San Gabriel Mountains and at San Marcos Pass in Santa Barbara County. The 1938 storm was a higher intensity shorter duration storm but the January 1969 storm totals are the greatest on record. Channel flows approached those reached in 1938. Near record flows occurred in most channels; a few exceeded previous records. Preliminary peak flows by the Corps of Engineers for selected locations were as follows:

River	Peak Flow (c.f.s.)	Design Flow (c.f.s.)
Ventura	55,000	150,000
Santa Clara	165,000	225,000
Los Angeles	110,000	146,000
San Jacinto	60,000	110,000
Santa Ynez (Lompoc)	100,000	---
Santa Ynez (Cachuma Res.)	80,000(spill)	---

Property damage in San Luis Obispo, Santa Barbara, Ventura, Los Angeles, Orange, San Bernardino, and Riverside Counties in southern California was estimated at near $125 million. Only minor flooding occurred in San Diego County where the rain was beneficial in restoring underground water levels. Damage resulted from erosion in canyons, mudslides in foothill communities, and inundation in low flatland areas. Hundreds of homes were damaged or destroyed by mudslides and several bridges were washed out. Forty-seven deaths were directly attributable to the storm. Of these, at least 20 persons were drowned and 19 deaths resulted from mudslides.

The flooding on the Salinas River in California on the 25-27th was the most severe since 1952. This flooding was due to heavy rain over the headwaters during the afternoon of the 24th. Santa Margarita reported 6.55 inches of rain during the 24-hour period ending at 8 a.m. on the 25th. During the same period, Paso Robles reported less than 2 inches, and Salinas about 1 inch. It is estimated that heavy rain occurred on the east side of the Salinas Basin from King City southward and over the San Lorenzo Basin. The antecedent conditions were favorable for heavy runoff as the heavy rain on the 18th and 19th caused a heavy base flow after the stream receded. Considerable flooding occurred at Priest Valley, Calif., on the San Lorenzo, a tributary of the Salinas. Record flow occurred at San Lorenzo and at Bradley, Calif. The Salinas River at Bradley, Calif., crested 3.9 feet above flood stage on the 25th and at Spreckles, Calif., 3.1 feet above flood stage on the 27th.

San Joaquin Basin.--Record precipitation fell over most of the San Joaquin Basin, particularly south of Yosemite Valley. Some stations reported over 600% of January normal, and the entire basin averaged well over 300%. During the period Jan. 18-27, several stations reported between 35 to 40 inches of precipitation. The snowpack in the southern Sierra Nevada reached record depths and in some areas approached that of 1962.

There were two periods of significant flooding in the San Joaquin Basin. The first overflow occurred on the 19th-23d, and the second on the 25-27th. Actual rainfall accumulations varied widely from station to station, but 24-hour amounts between 5 and 9 inches were measured at several places on the 19-20th and again on the 25-26th. In general, there was more precipitation in the first storm, but the runoff from the second was much greater. The two-day interval between the storms left the ground saturated and runoff from the second storm was almost instantaneous.

Major damages occurred on the Chowchilla and Fresno Rivers and along streams running into the valley from the foothill areas. There was also considerable damage caused by ponding on the valley floor from some of the heaviest rainfalls on record. Tributary streams of the Kings River measured their highest flows of record. Sycamore Creek which enters the Kings River above Pine Flat Reservoir crested at 13.0 feet on the 25th compared to 9.8 feet in 1954. This was more than twice the previous record discharge. However, the Kaweah River at Three Rivers crested at 14.0 feet on the 25th compared to 22.2 feet in 1966.

Peak flows moving down the Tuolumne River caused flooding in the city of Modesto, Calif., along the river. The Stanislaus River caused some flooding in and around the city of Ripon, Calif. Farther downstream, one-half mile above its junction with the San Joaquin some 5,000 acres were flooded and remained under water through the end of January. Warning stages were reached or exceeded at all points and danger or flood stages were reached or exceeded at several points. The San Joaquin River at Vernalis, Calif. reached a crest of 34.3 feet on the 27th, the highest stage of record.

Most of the damage resulted to agricultural lands and inundation of homes in small communities and portions of the city of Fresno. Ponding was responsible for much of the communities of Cutler, Orosi, Woodlake, Lindsay, Yettem, and Seville being inundated and more than 500 persons had to flee their homes. Water was from 1 to 2 feet deep in places in these communities. More than $1 million damage has been estimated to ditches in the Fresno Irrigation District. A family of four was marooned for 4 days in heavy snow in the Sierras west of Johnsondale, but suffered only frostbite. One youth was missing and assumed drowned while trying to swim the San Joaquin River north of Fresno, Calif., on the 24th. A small child was killed on the 25th when the truck in which she was riding overturned as it hit a flooded portion of a country road. There were many accidents attributed to the rain but only 4 other lives were lost. Most county and stage roads were either washed out, or blocked by mud- and rockslides. Millions of dollars in road and culvert damage was sustained in the national forests and national parks. The total cost of damage in Fresno, Tulare, and Kern Counties were estimated slightly in excess of $31 million. Preliminary estimates by the Corps of Engineers for the Stanislaus, Tuolumne and the main stem of the San Joaquin River were placed at $ 6 million.

Sacramento Basin.--Precipitation during January over the Sacramento drainage ranged from around 200% to over 400% of the January normal. Snow accumulation by month's end was near 200% of normal at high levels and 250% of normal at the 5,000-foot level in the Sierra. These amounts are near those of the record snow-year of 1952 at a number of points on the same date.

Eight major crests moved down the Sacramento River during January. Warning stages were exceeded at many points and flood or danger levels were exceeded at Butte City and Lisbon and at all weirs. No record high levels were reached on the Sacramento River. Stages on the lower Sacramento approached the danger level of 29 feet at Sacramento, Calif., and necessitated opening 16 gates of the Sacramento Weir on the 21st.

These gates remained open through the end of the month.

All Yolo Bypass islands were flooded by the 21st. Ample warning permitted early evacuation of all people and moving farm equipment from the bypass islands to safety. In the Sacramento Delta, more than 10,000 acres of agricultural land were flooded.

Preliminary damage estimates by the U. S. Corps of Engineers for the Sacramento Basin was placed at $9 million.

Russian Basin.--There were two periods of flooding on the Russian River at Guerneville, Calif. The first occurred on the 12-14th and was due to rainfall averaging about 8 inches. Moderate rainfall amounts occurred in the headwater and the Santa Rosa sectors. The precipitation in the Guerneville-Venada-Healdsburg sector was heavy and accounted for about two-thirds of the average. The flow from this sector crested at Healdsburg before the crest arrived from upstream. As a result, the flooding was moderate and confined mostly to the southern portion of the river. The crest at Guerneville on the 13th was 11 feet above flood stage.

During the second flood on the 20th-22d, the average rainfall and distribution was similar to that during the first flood. However, the rainfall was spread over 4 days instead of 3 days as during the first overflow. Consequently, the crest at Guerneville was about 5 feet lower than in the first flood. Only minor damage resulted from the two floods in the Russian Basin.

Eel Basin.--There were two floods on the Eel River at Fernbridge, Calif., during January. The first overflow occurred on the 12-14th with a crest 5.1 feet above flood stage on the 13th. The second flood occurred on the 20th-22d with a crest of 4.5 feet above flood stage on the 21st. The water spread out over farmlands near the river from Fernbridge, Calif., to the mouth. Mostly pastureland (not cropland) was affected. There was a moderate deposit of silt and debris.

The Van Duzen River near Bridgeville, Calif., crested 4.3 feet above flood stage on the 13th and 2.9 feet above flood stage on the 20th. Residents in a low area were evacuated both times as a precautionary measure. No particular damage was reported except for considerable mud in the lower part of the flats.

A state of disaster was declared for Humbolt County. Most of the loss and difficulty came from storm damage, not flooding. There were many slides and slipouts on State and County roads. The California Division of Highways reports approximately $3 million damage to their highway system and Humbolt County estimated their loss at $1 million. Only $50,000 of this amount is directly attributable to flooding in the Eel River.

Warnings had been given out sufficiently far in advance that stock and machinery worth nearly $4.5 million had been moved to safe ground.

Coquille Basin.--Heavy rain around the middle of January caused the Coquille River to rise above flood stage along the Middle and South Forks. The South Fork Coquille rose 1 foot above flood stage on the 11th and 2.6 feet above flood stage on the 13th and 14th. The main stem of the Coquille River rose to within 0.2 foot of flood stage on the 13th. Damage along the Coquille River was at a minimum.

The heavy snowfall during the last few days of January did appreciable damage, isolating communities and collapsing buildings. The community of Powers, Oreg., on the south fork of the Coquille River was without telephone or electrical power for 3 days. Normal power and communications were not restored for more than a week.

Columbia Basin.--January was one of the coldest and snowiest on record for most of the Columbia Basin. It was also the 6th consecutive month with precipitation above average. Substantial increase in snowpack occurred in the mountains.

Considerable flash flooding occurred on tributaries to the Clearwater River in Idaho, where drainage was poor, due to warming and snowmelt on the 5-7th. Flash flooding also occurred in the upper Snake Basin in the areas of Idaho Falls, Rexburg, Blackfoot, and Barcroft, Idaho, due to warming and snowmelt associated with icejams.

Minor flooding occurred on the Coeur d'Alene River at Kingston, Idaho, on the 7th. A few families were evacuated, but freezing temperatures stopped the snowmelt and damage was very light.

Some of the low elevation Willamette Tributaries experienced moderate rises over the New Year Holiday.

The Pudding River at Aurora, Oreg., rose 1 foot above flood stage on the 2d and receded within its banks on the 4th. Temperatures moderated and freezing levels rose by the 5th. Heavy precipitation on the 6-11th caused a gradual rising along the Willamette River. At Salem, Oreg., the river rose from 60,000 c.f.s. on the 5th to 100,000 c.f.s. on the 12th. The uncontrolled low elevation coast range tributaries exceeded flood stage. Several streams had multiple rises above flood stage. The second rise of Johnson Creek crested 4.2 feet above flood stage on the 7th, inundating some 600 acres.

Considerable flood damage occurred in the Tucannon and Touchet drainages in Washington and in the upper reaches of the Walla Walla River of Oregon. The Umatilla River at Pendleton, Oreg., crested 1.1 feet above flood stage on the 6th. Levees prevented extensive flooding. Flood damage in the lower Snake River drainages was estimated by the Corps of Engineers at $542,000 and in the Willamette Basin tributaries at $307,000. According to news stories, damages in southeastern Washington were nearly as high as in the December 1964 and January 1965 floods.

During the last week in January, snow accumulated over the Columbia Basin and by the 30th the following snow depths were reported: Astoria, Oreg., 18 inches; North Bend, Oreg., 14 inches; Portland, Oreg., 10 inches; Salem, Oreg., 10 inches; Eugene, Oreg., 34 inches; Pendleton, Oreg., 15 inches; and Walla Walla, Wash. 19 inches.

PUDGET SOUND DRAINAGE

The western Cascade Rivers in Washington exceeded flood stage on the 4-7th. Most of the flooding occurred in the Nooksack, Snohomish, and Snoqualmie Valleys. This flooding was due to warm rains averaging around 5 inches in 4 days on top of a heavy low-level snowpack. Lowland temperatures reached the 50's in 2 days. Flooding in the Nooksack was aggravated by an icejam at a bridge near its mouth near Marietta, Wash., which caused overflow into the town.

Flood damage was caused mostly by overflow of farmland, low-lying roads and some residences in the Snohomish and Snoqualmie Valleys. Overflow into the town of Marietta on the Lower Nooksack was due to an icejam. The high water in the Snohomish was similar to the flood of 1967. The flood in the Snoqualmie was the highest since 1959. A number of families were evacuated but no lives were lost. Flood damages were estimated at over $2 million by the Corps of Engineers.

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G.C.T.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska

JANUARY 1969

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
Langleys. . .	-76	-61	-51	-59	-92	-37	-34	-88	-113	-108	-116	-108	-76	-62	-61	-58

Date.	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	-37	-68	-39	-36	-23	-23	-33	-52	-53	-46	-45	-49	-22	-27	-32	-58

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the ESSA, Weather Bureau.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (< 3900 A) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
Langleys. . .	9.47	6.71	9.57	9.87	1.63	8.48	6.90	4.73	9.77	9.67	4.63	7.50	7.69	6.21	1.48	7.20

Date.	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	3.35	6.11	6.51	3.75	3.84	1.48	2.96	9.47	10.46	7.50	2.76	5.43	2.76	10.65	10.85	6.52

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the ESSA, Weather Bureau.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code [illegible] defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atm-cms

Station	Day of month

DESCRIPTION OF CHARTS

CHART I., A. NORMAL DAILY AVERAGE TEMPERATURE (°F. 1931-60) FOR MONTH. B. TEMPERATURE DEPARTURE FROM 30-YEAR MEAN (°F. 1931-60) FOR MONTH. Chart I-A is reproduced from Environmental Data Service Publication "Climatic Maps of the United States". Chart I-B is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin", a publication of Environmental Data Service.

CHART II. TOTAL PRECIPITATION. -CHART II is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin".

CHART III. PRECENTAGE OF NORMAL PRECIPITATION. -Chart III is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin".

CHART IV. TOTAL SNOWFALL. CHART V. A. PERCENTAGE OF MEAN MONTHLY SNOWFALL. B. DEPTH OF SNOW ON GROUND. -Chart IV gives the total depth in inches of unmelted snowfall as reported during the month by Weather Bureau and selected cooperative stations. This is converted in Chart V-A into a percentage of the mean monthly total amount computed for each Weather Bureau station having at least 10 years of record. The depth of snow on ground is that reported by both Weather Bureau and selected cooperative stations as of 7:00 a.m. Eastern Standard Time on the Monday nearest the end of the month. This is reported only for the months December through March. The snowfall charts are presented each month November through April.

Isolines for Charts I, II, III, IV, and V, are drawn through points of approximately equal value. Caution should be used in interpolating on these charts, particularly in mountainous areas.

CHART VI. A. PERCENTAGE OF POSSIBLE SUNSHINE. B. PERCENTAGE OF MEAN MONTHLY SUNSHINE. -CHART VI-A shows the amount of sunshine received in terms of percentage of the total hours of sunshine possible during the month. In Chart VI-B this is shown as a percentage of the mean number of hours of sunshine received. Means are computed for Weather Bureau stations having at least 10 years of record.

CHART VII. A. AVERAGE DAILY VALUES OF SOLAR RADIATION LANGLEYS. B. PERCENTAGE OF MEAN DAILY SOLAR RADIATION.-Shown on Chart VII-A are the monthly averages of daily total solar radiation, both direct and diffuse, in langleys (gm. cal. cm.-2) for all Weather Bureau and selected cooperative stations which record this element. The analyses include adjustments required to bring station records to approximately the same level of calibration. Adjusted numbers are in parentheses.

CHART VII-B shows the percentages of the mean based on at least 5 years of record during the period 1950-1960, and corrected to the International Pyrheliometer Scale of 1956.

CHART VIII. -TRACKS OF CENTERS OF ANTICYCLONES AT SEA LEVEL.

CHART IX. TRACKS OF CENTERS OF CYCLONES AT SEA LEVEL. -Centers which can be identified for 24 hours or more are tracked in these charts. Semipermanent features such as the Great Basin and Pacific Highs and Colorado and Mexico Lows are not shown. The 7:00 a.m. EST positions are shown by open circles, with the intermediate positions at 6-hour intervals shown by solid dots. The date is given above the circle and the central pressure to whole millibars below. A dashed track indicates a regeneration rather than actual movement to the next position. Solid squares indicate position of stationary center for period shown beside it.

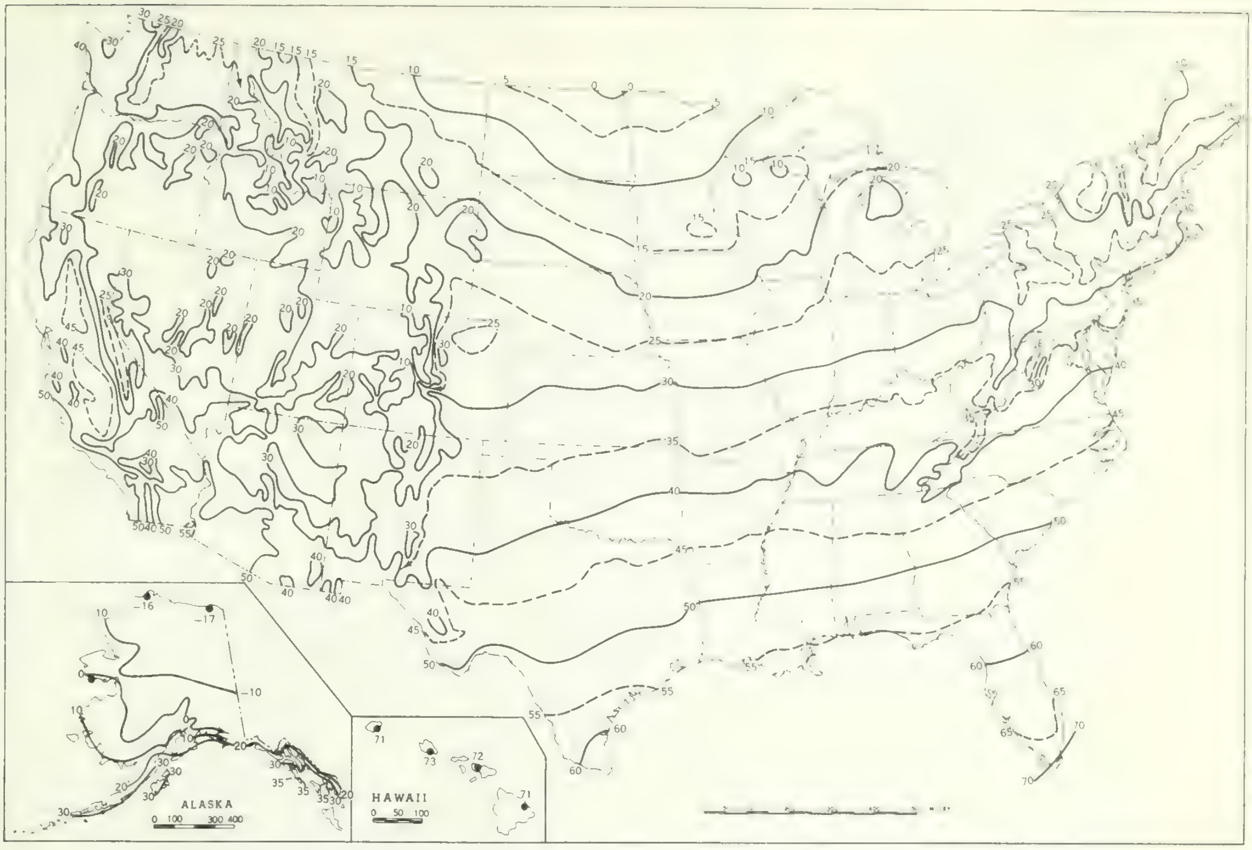
CHART X. AVERAGE SEA LEVEL PRESSURE (mb.) AND RESULTANT SURFACE WIND. -The average monthly sea level pressures are obtained from eight daily 3-hourly observations reported at Weather Bureau Stations. Resultant surface wind directions (to 36 points of the compass) for the month are shown by arrows. Resultant speeds are in miles per hour and are indicated by the length of arrow shafts. Constancy ratios (resultant surface wind divided by average surface wind for month) are shown to two decimal places. The inset shows the departure of the average pressure based on 30-year normals for first-order Weather Bureau Stations, other stations having at least 10 years of record; and for each 10° intersection in a diamond grid over the oceans.

CHARTS XI-XVI. AVERAGE HEIGHT, TEMPERATURE, AND RESULTANT WINDS, 850, 700, 500, 300, 200, and 100 mb. -Height is given in geopotential meters and temperature in degrees Celsius. These are the averages of the 1200 GMT radiosonde reports. Wind speeds are given in meters per second; flag represents 25 m.p.s., full feather 5 m.p.s., and half feather 2 1/2 m.p.s. Directions are shown to 360° of the compass. Winds are based on rawins at the indicated pressure surface and at 1200 GMT.

CHART XVII. A. 50-MB. RESULTANT WINDS. B. 30-MB. RESULTANT WINDS. -Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. Winds are based on rawins at the indicated pressure surface and at 1200 GMT.

Exact values of most of these charted elements for Weather Bureau stations are printed each month in tabular form in CLIMATOLOGICAL DATA, NATIONAL SUMMARY. Extreme values of temperature and precipitation for each state are included in the tables, Condensed Climatological Summary. Annual averages for surface elements are presented in the CDNS Annual Issue each year.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), January



B. Temperature Departure from 30 - Year Mean (°F 1931-60), January 1969.

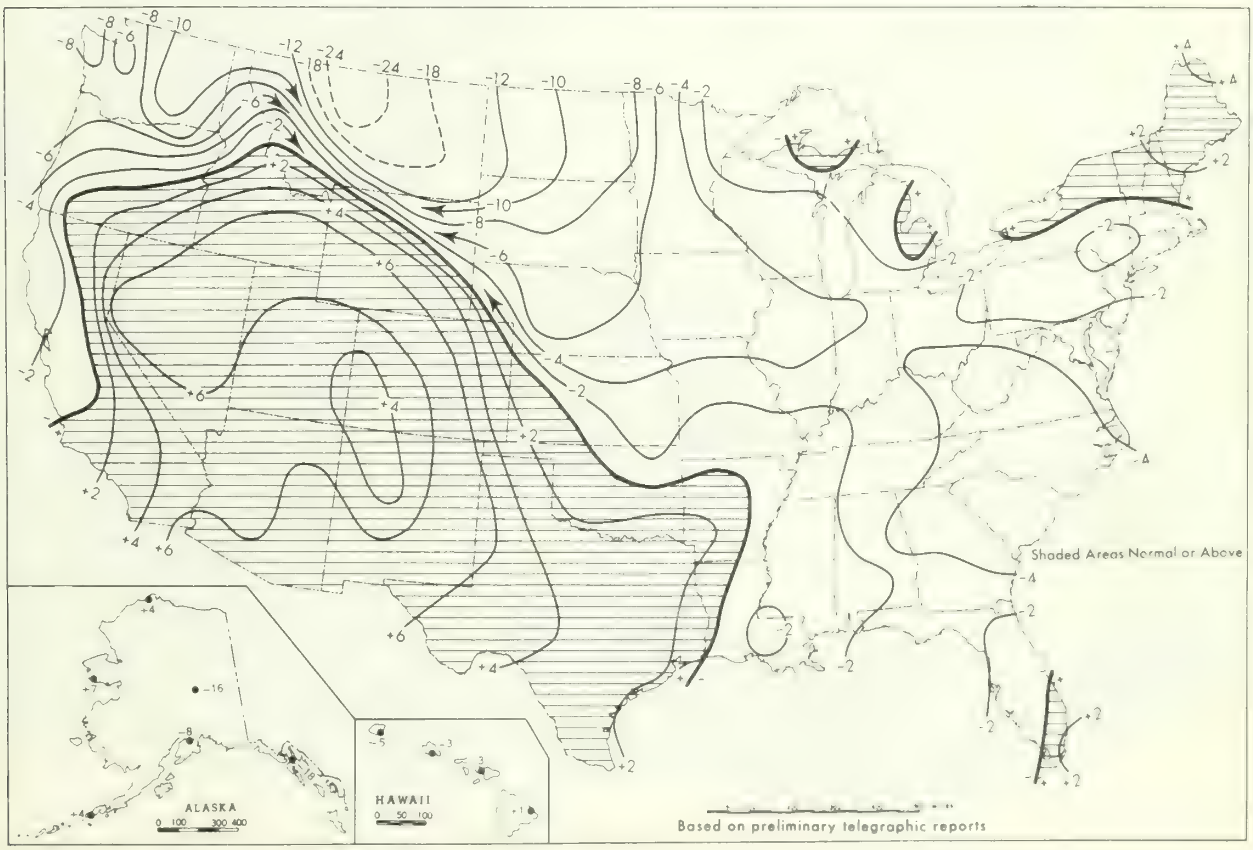


Chart II. Total Precipitation (Inches), January 1969.

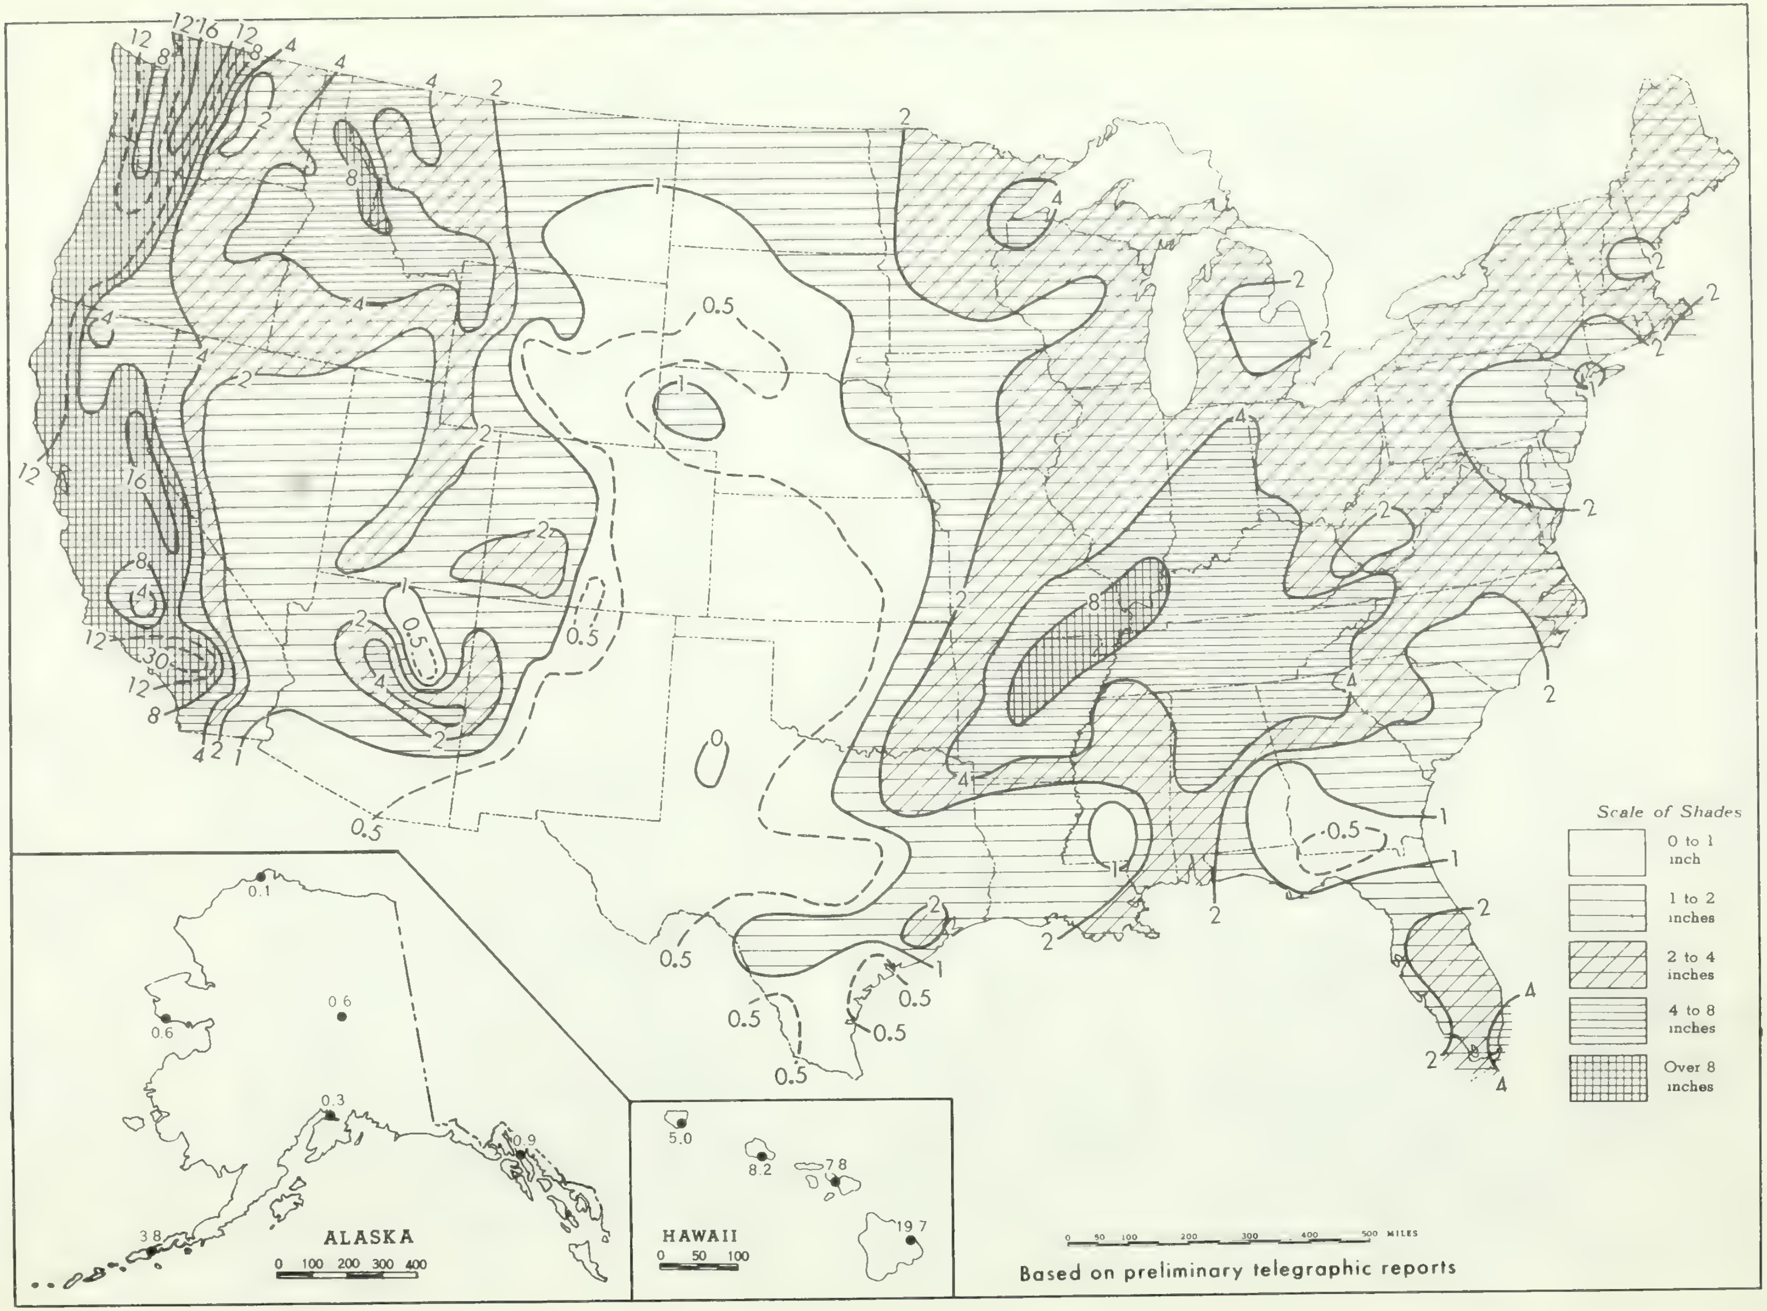

Chart III. Percentage of Normal Precipitation, January 1969.

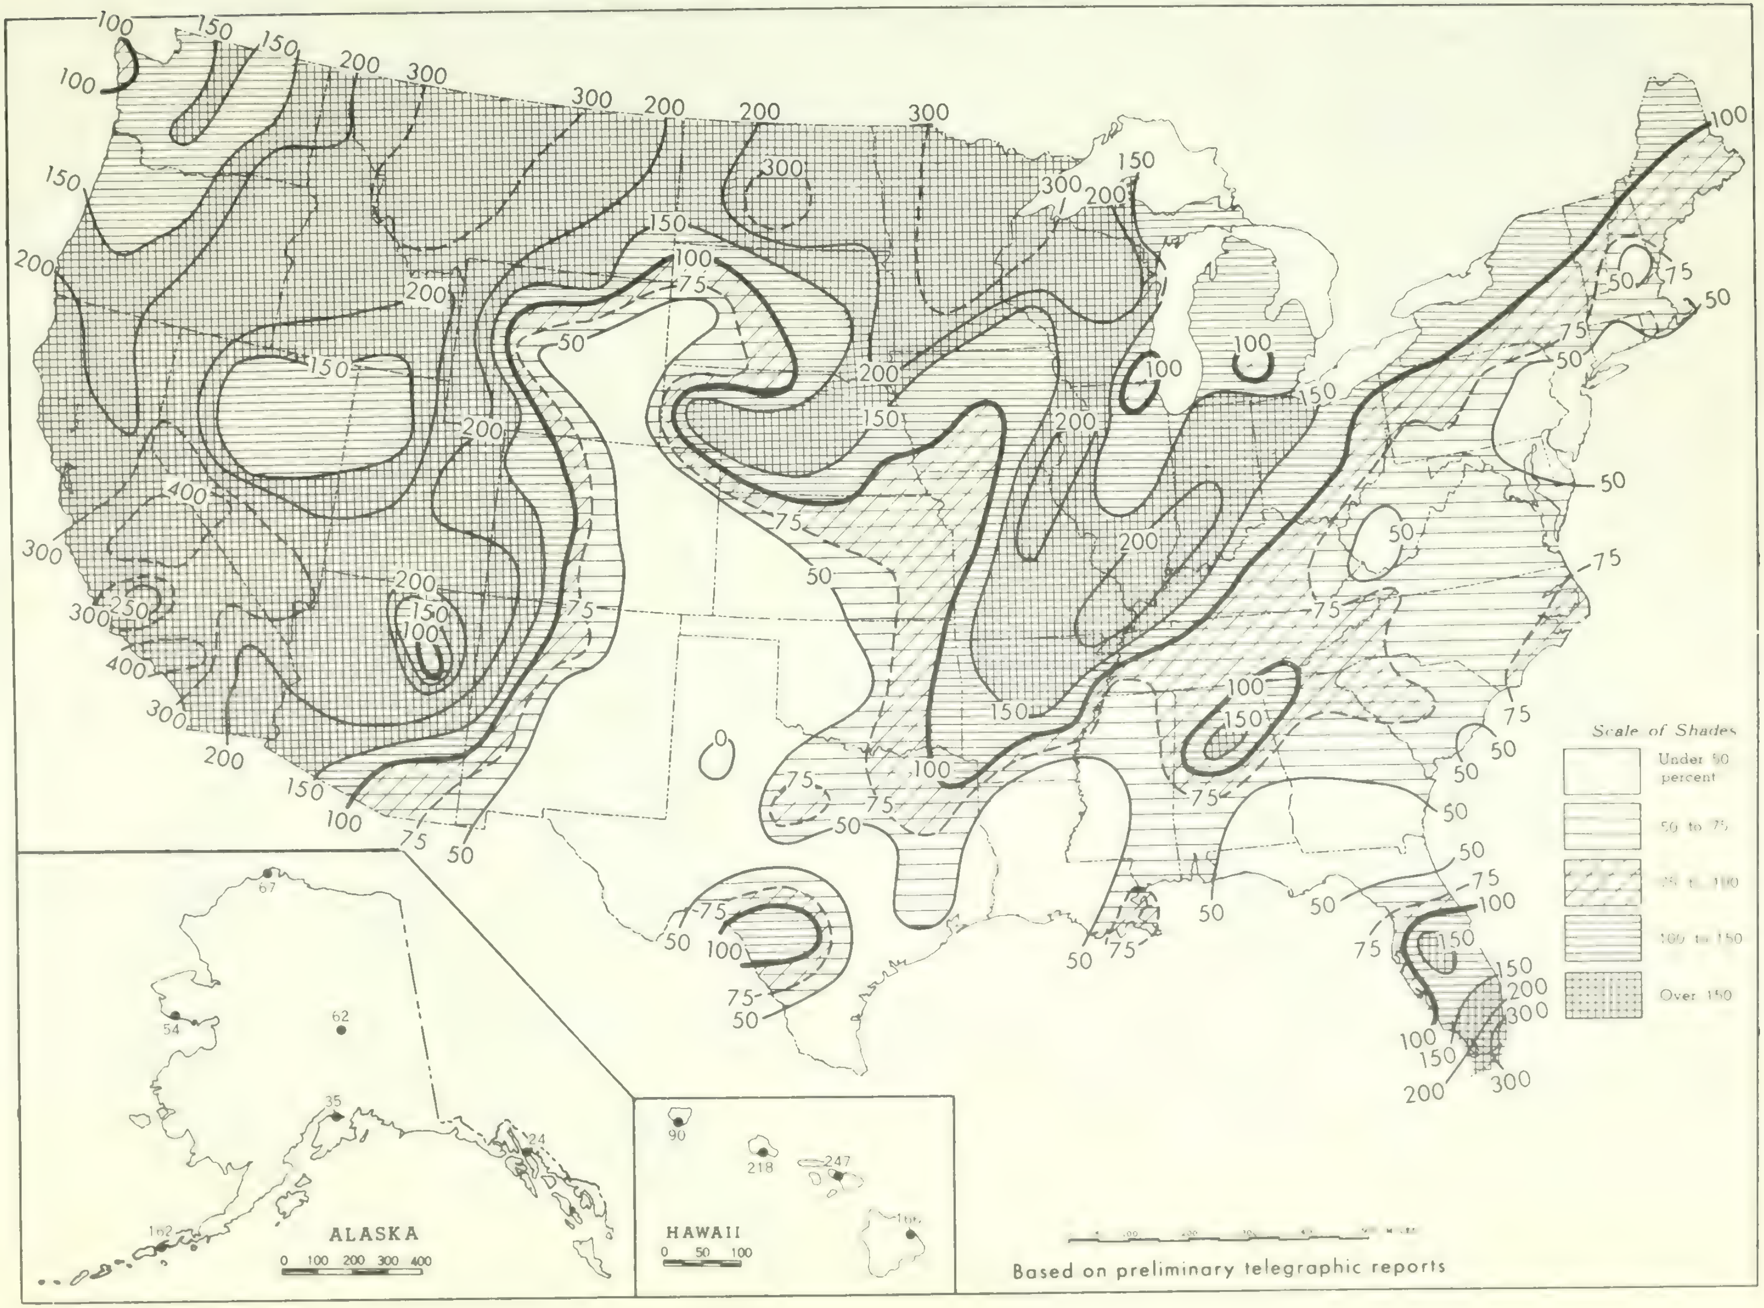

Chart IV. Total Snowfall (Inches), January 1969.

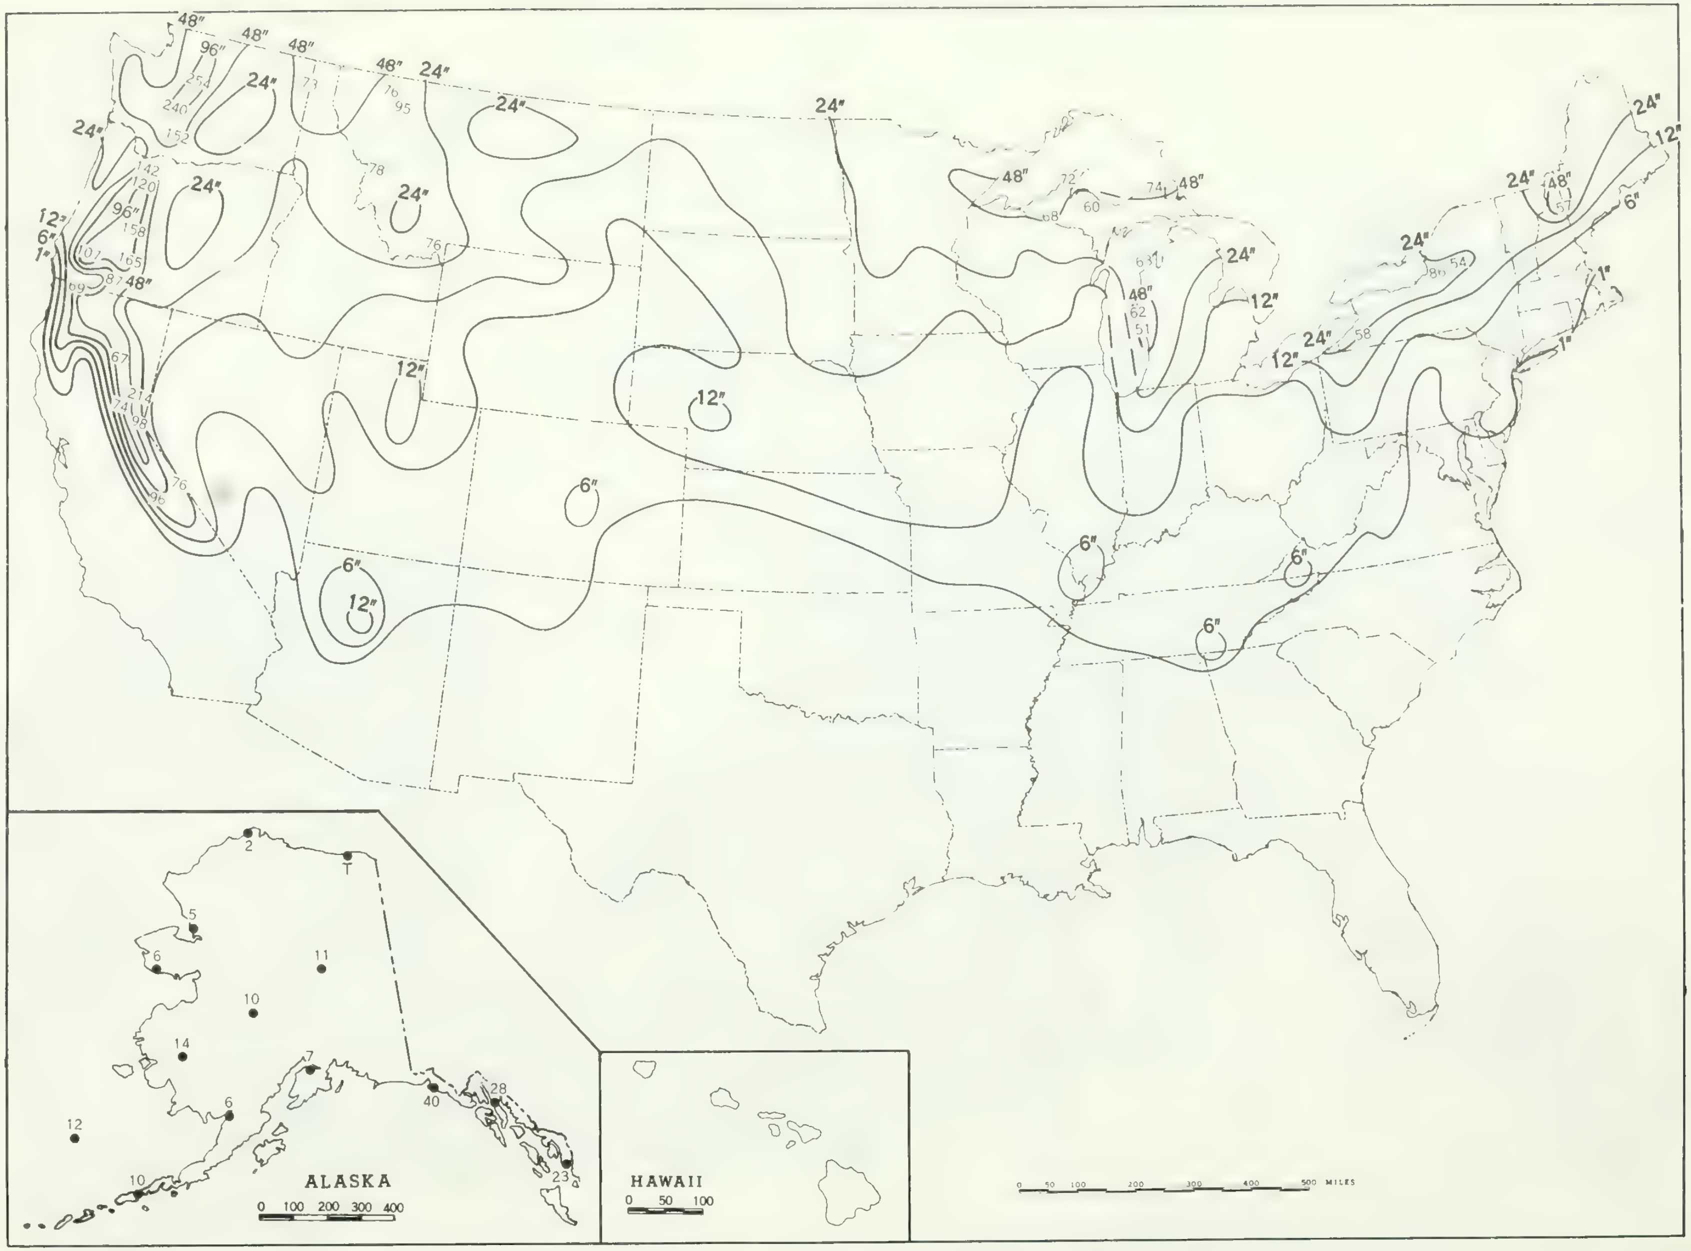
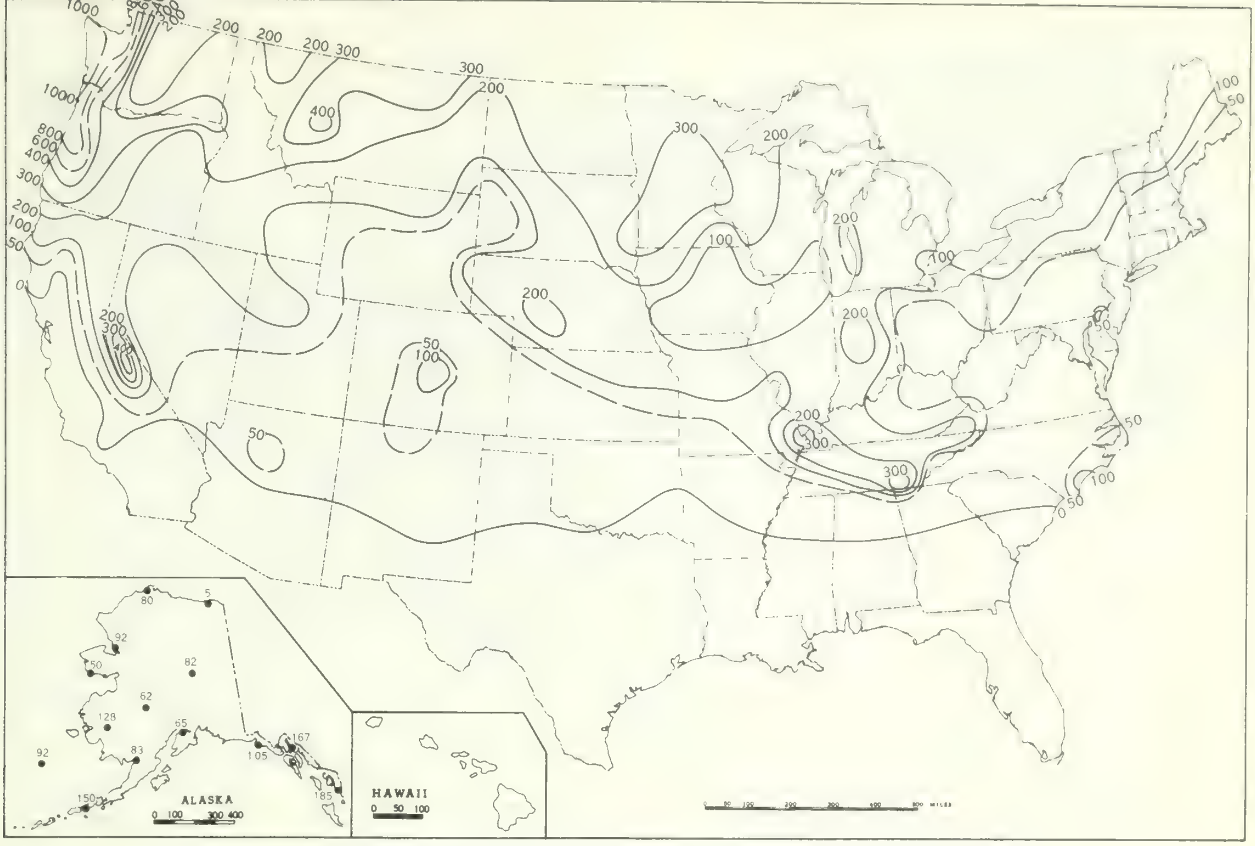
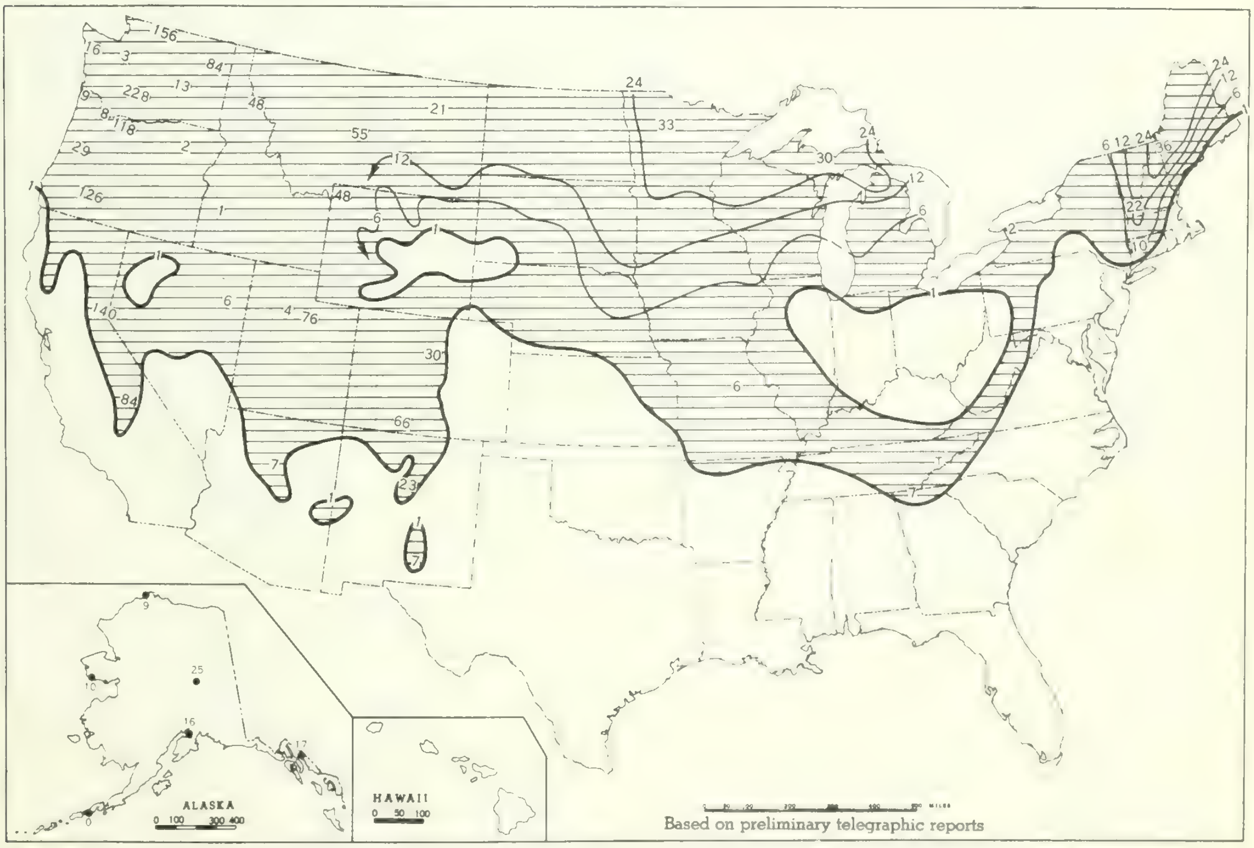


This is the total of unmelted snowfall recorded during the month at Weather Bureau and selected cooperative stations. This Chart and Chart V are published only for the months of November through April, although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, January 1969.

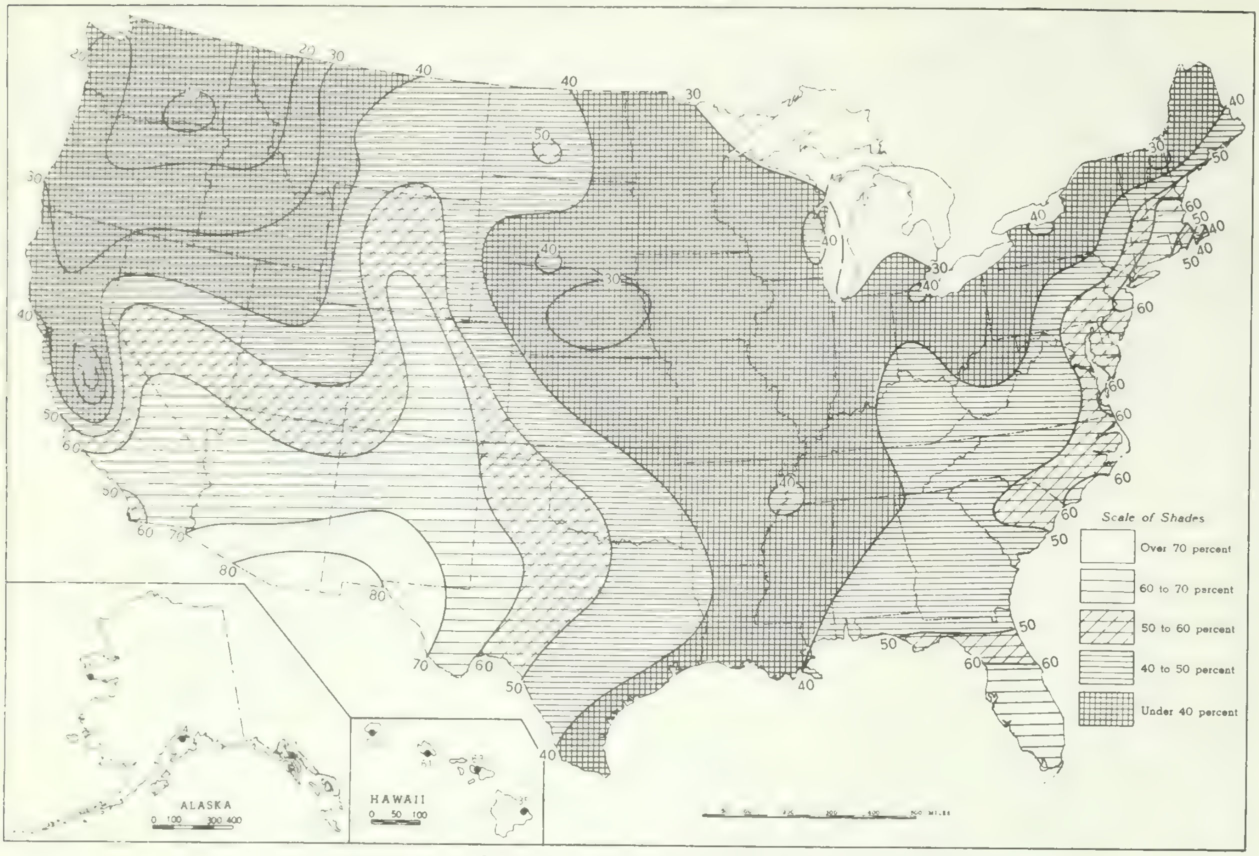


B. Depth of Snow on Ground (Inches), 7:00 a.m. E. S. T., January 27, 1969.

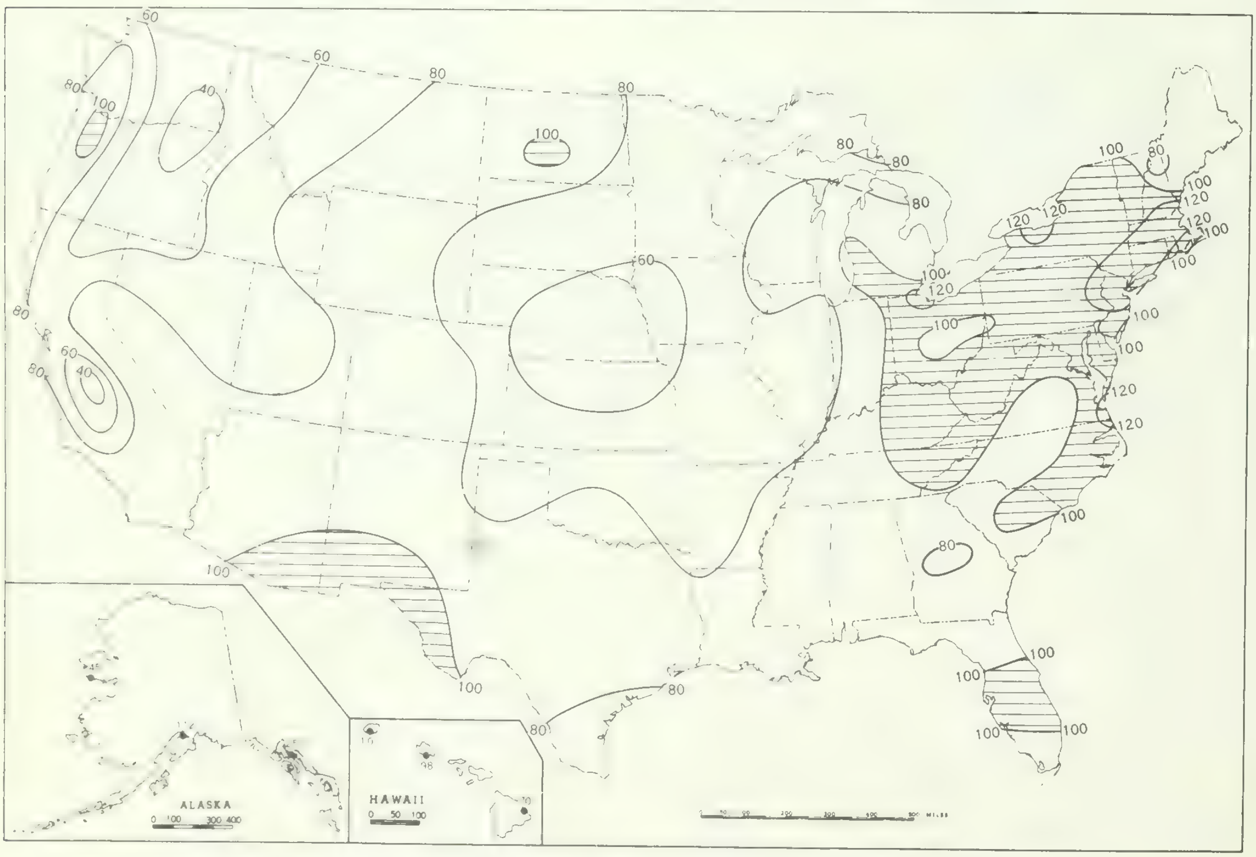


A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a.m. E.S.T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and selected cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, January 1969.

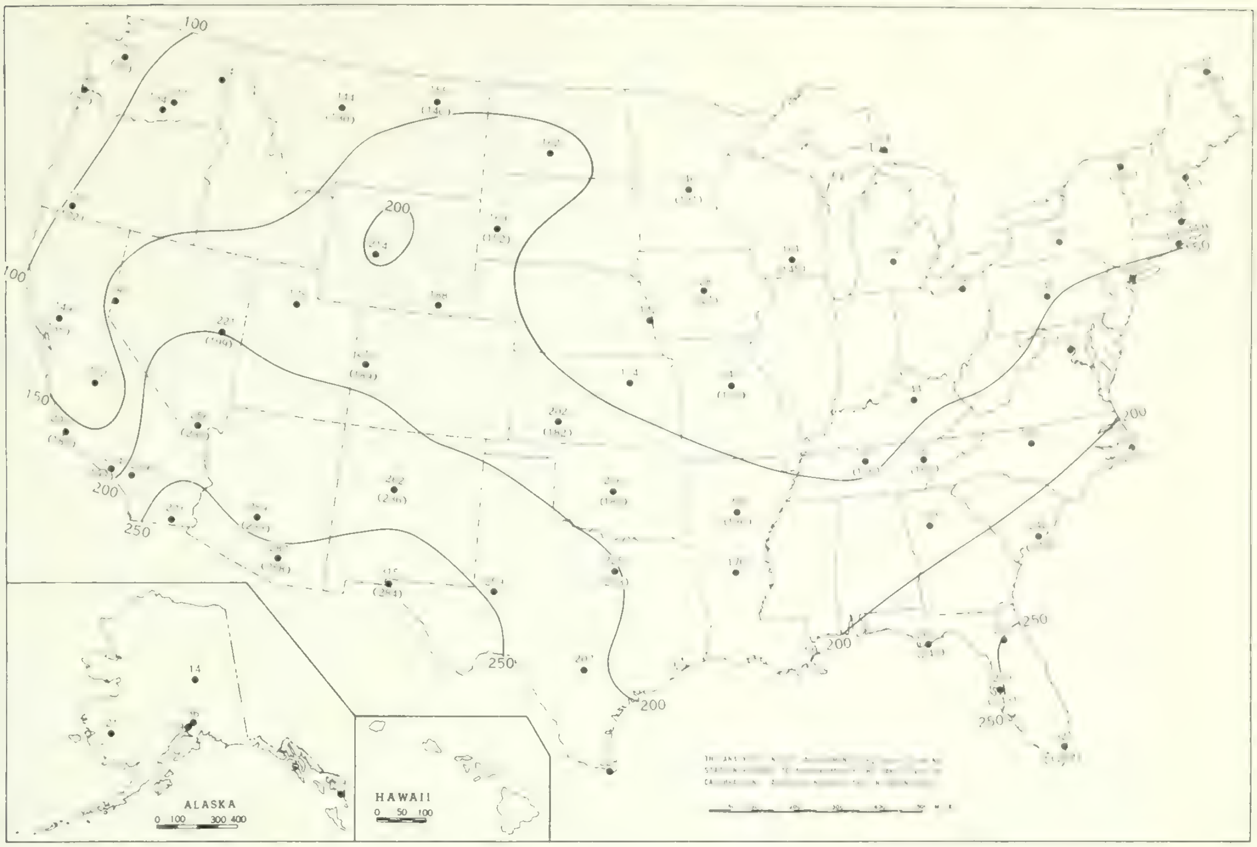


B. Percentage of Mean Monthly Sunshine, January 1969.

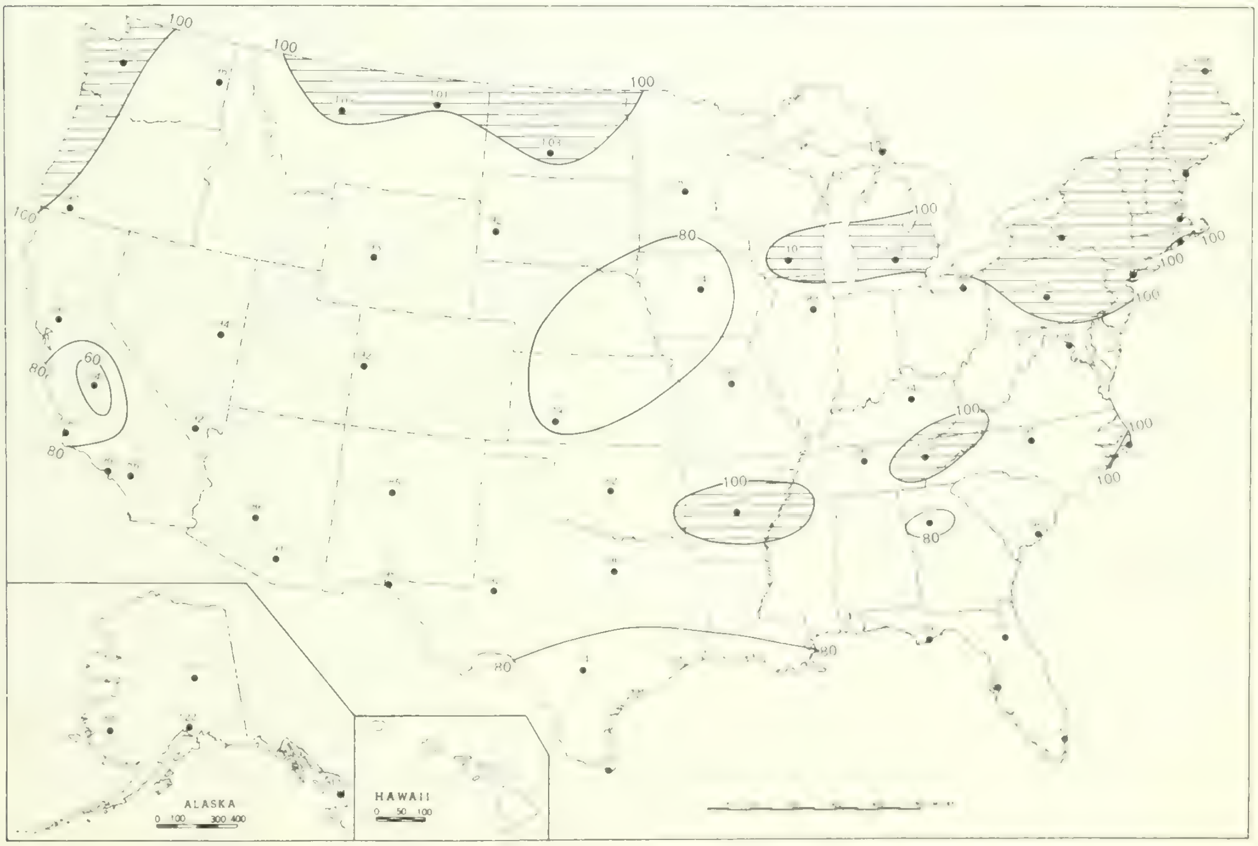


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, January 1969.



B. Percentage of Mean Daily Solar Radiation, January 1969.

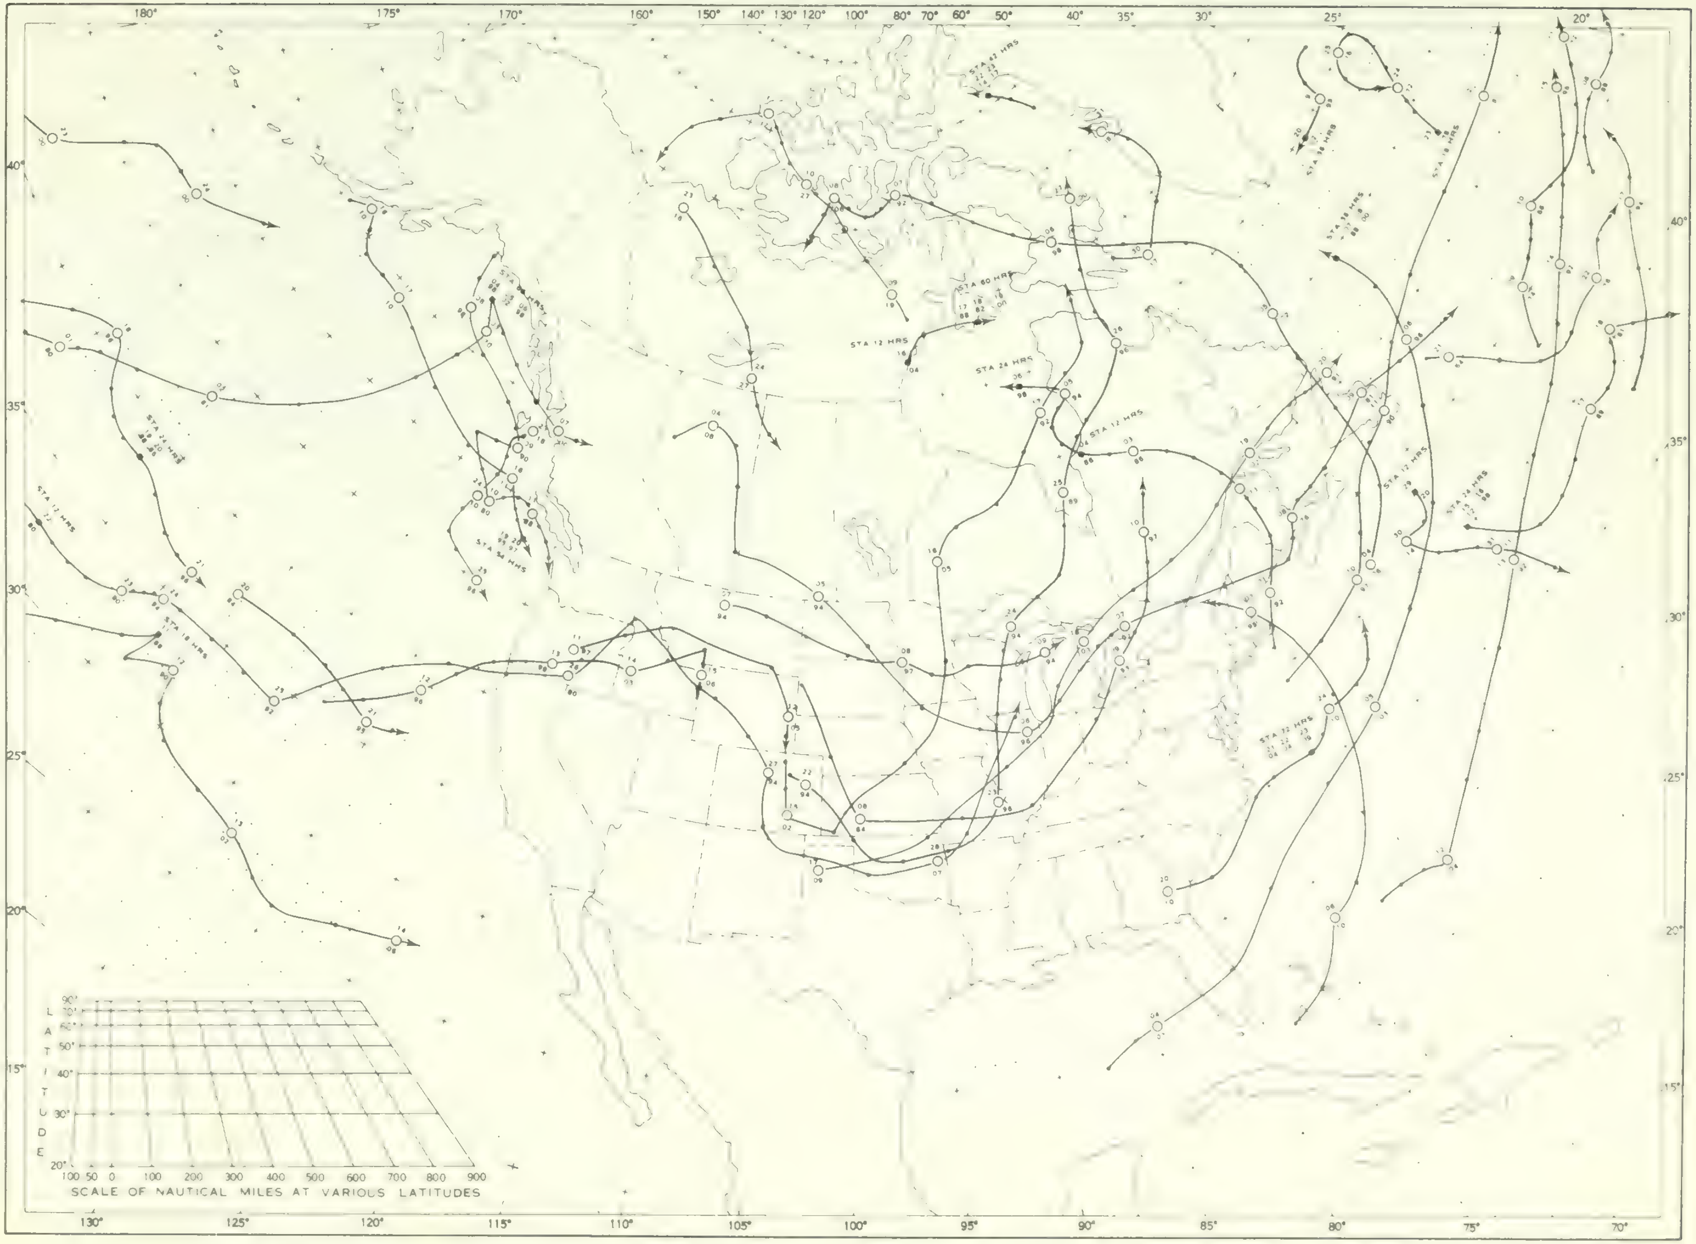


A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII Tracks of Centers of Anticyclones at Sea Level, January 1969.

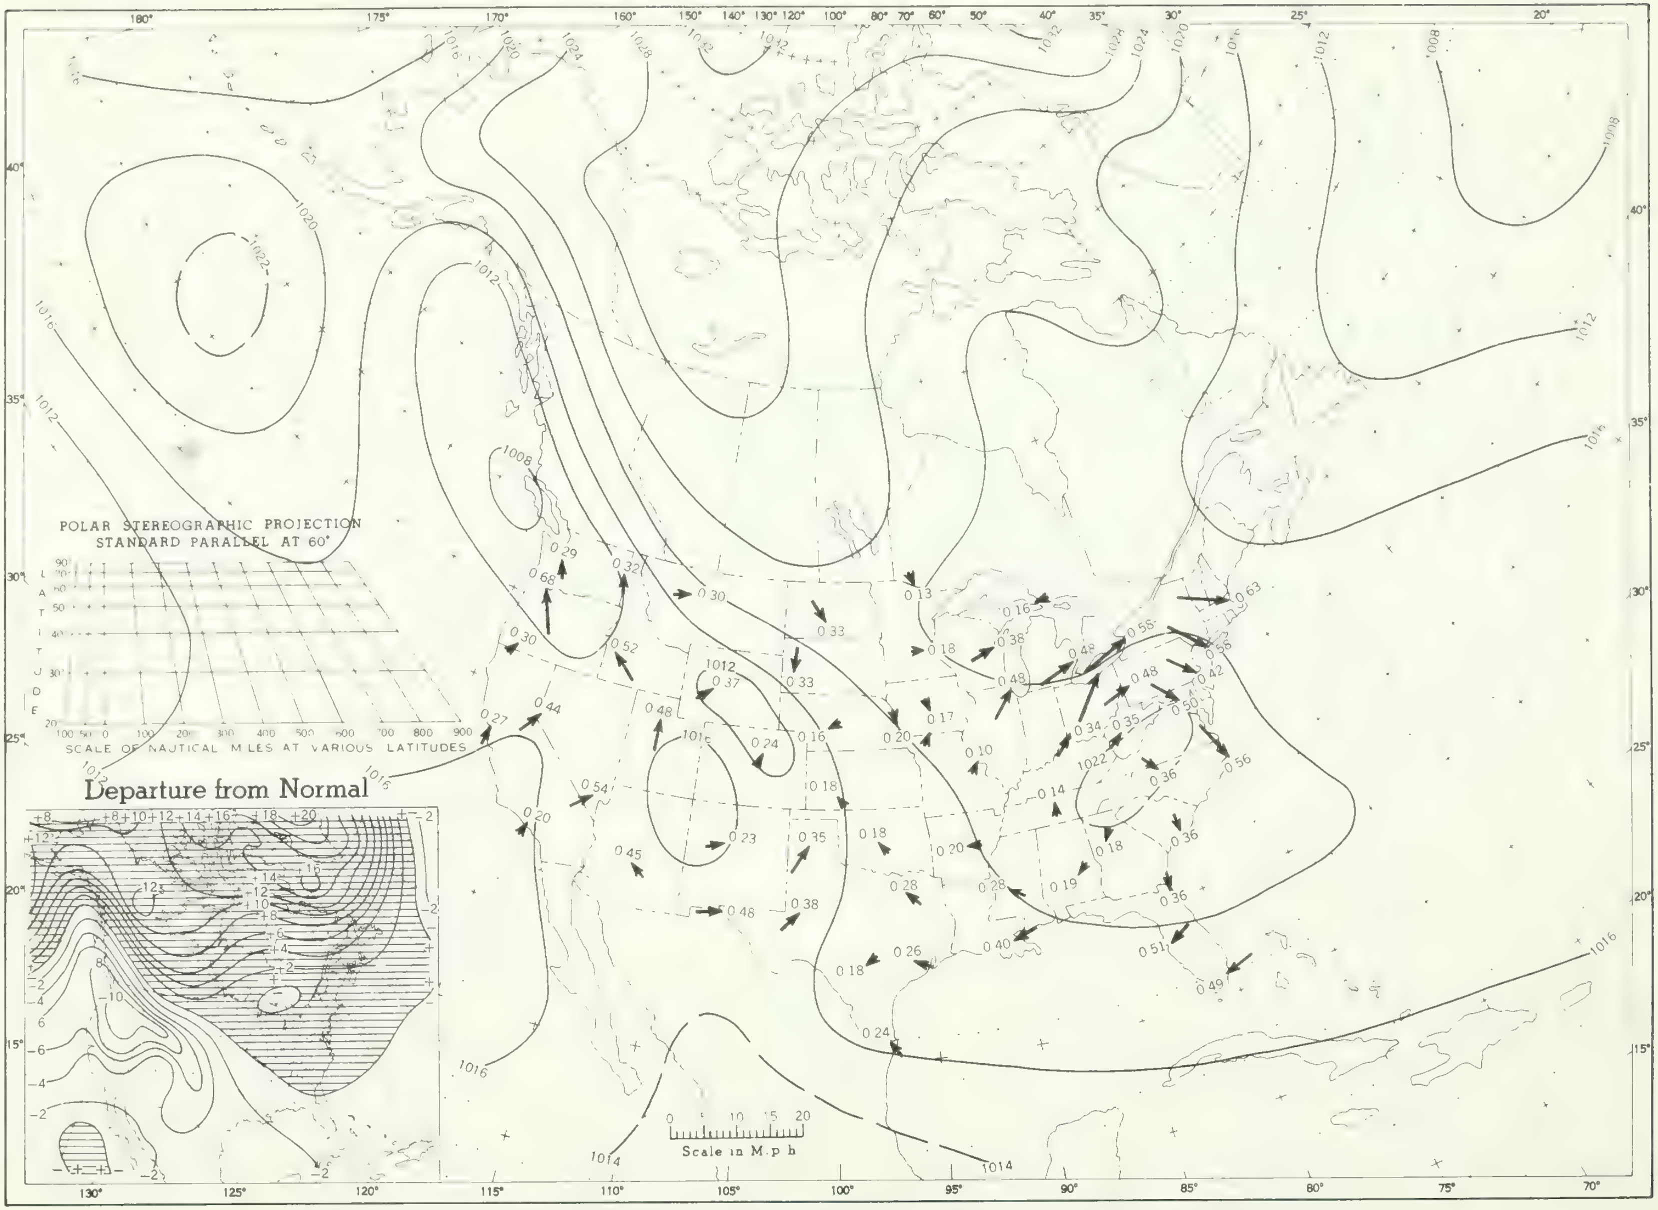
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, January 1969.



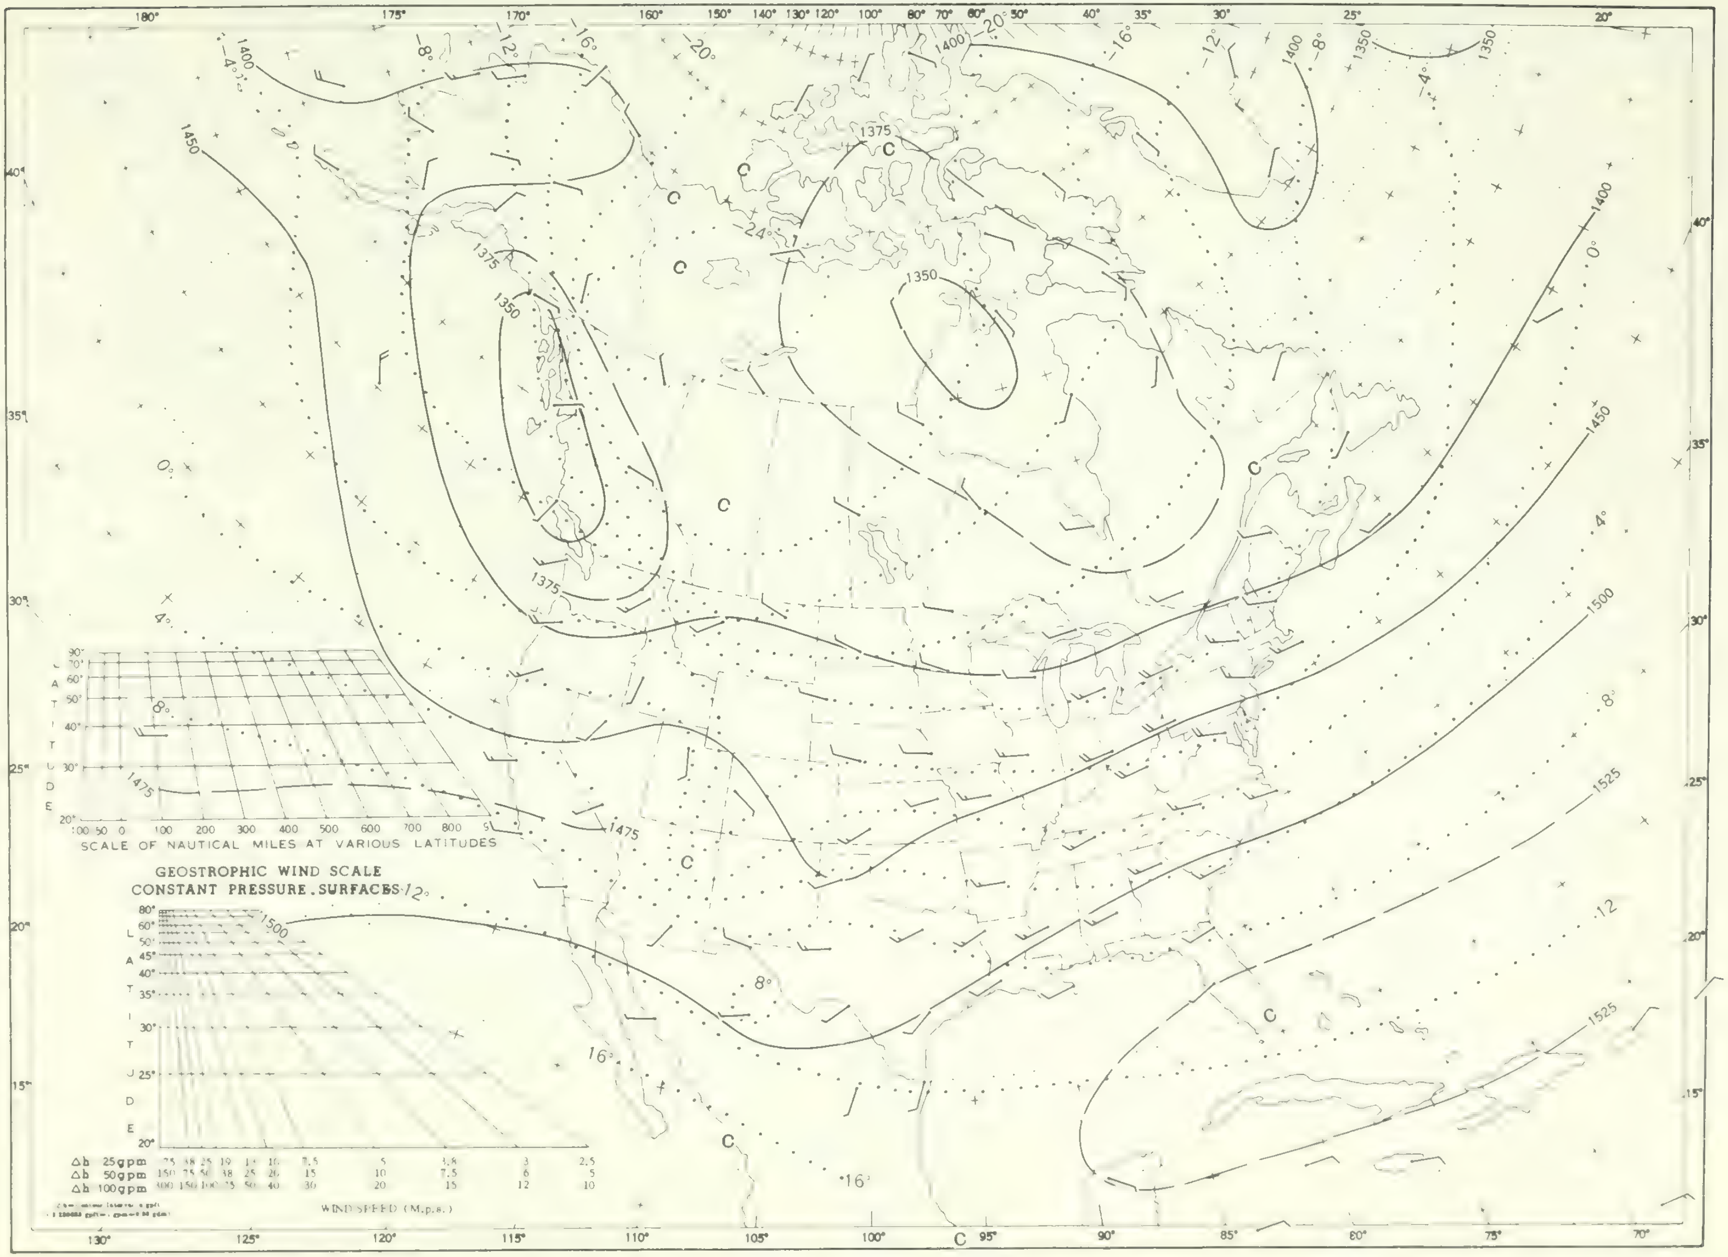
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included

Chart X Average Sea Level Pressure (mb) and Resultant Surface Wind, January 1969. Inset. Departure of Average Pressure (mb) from Normal, January 1969.



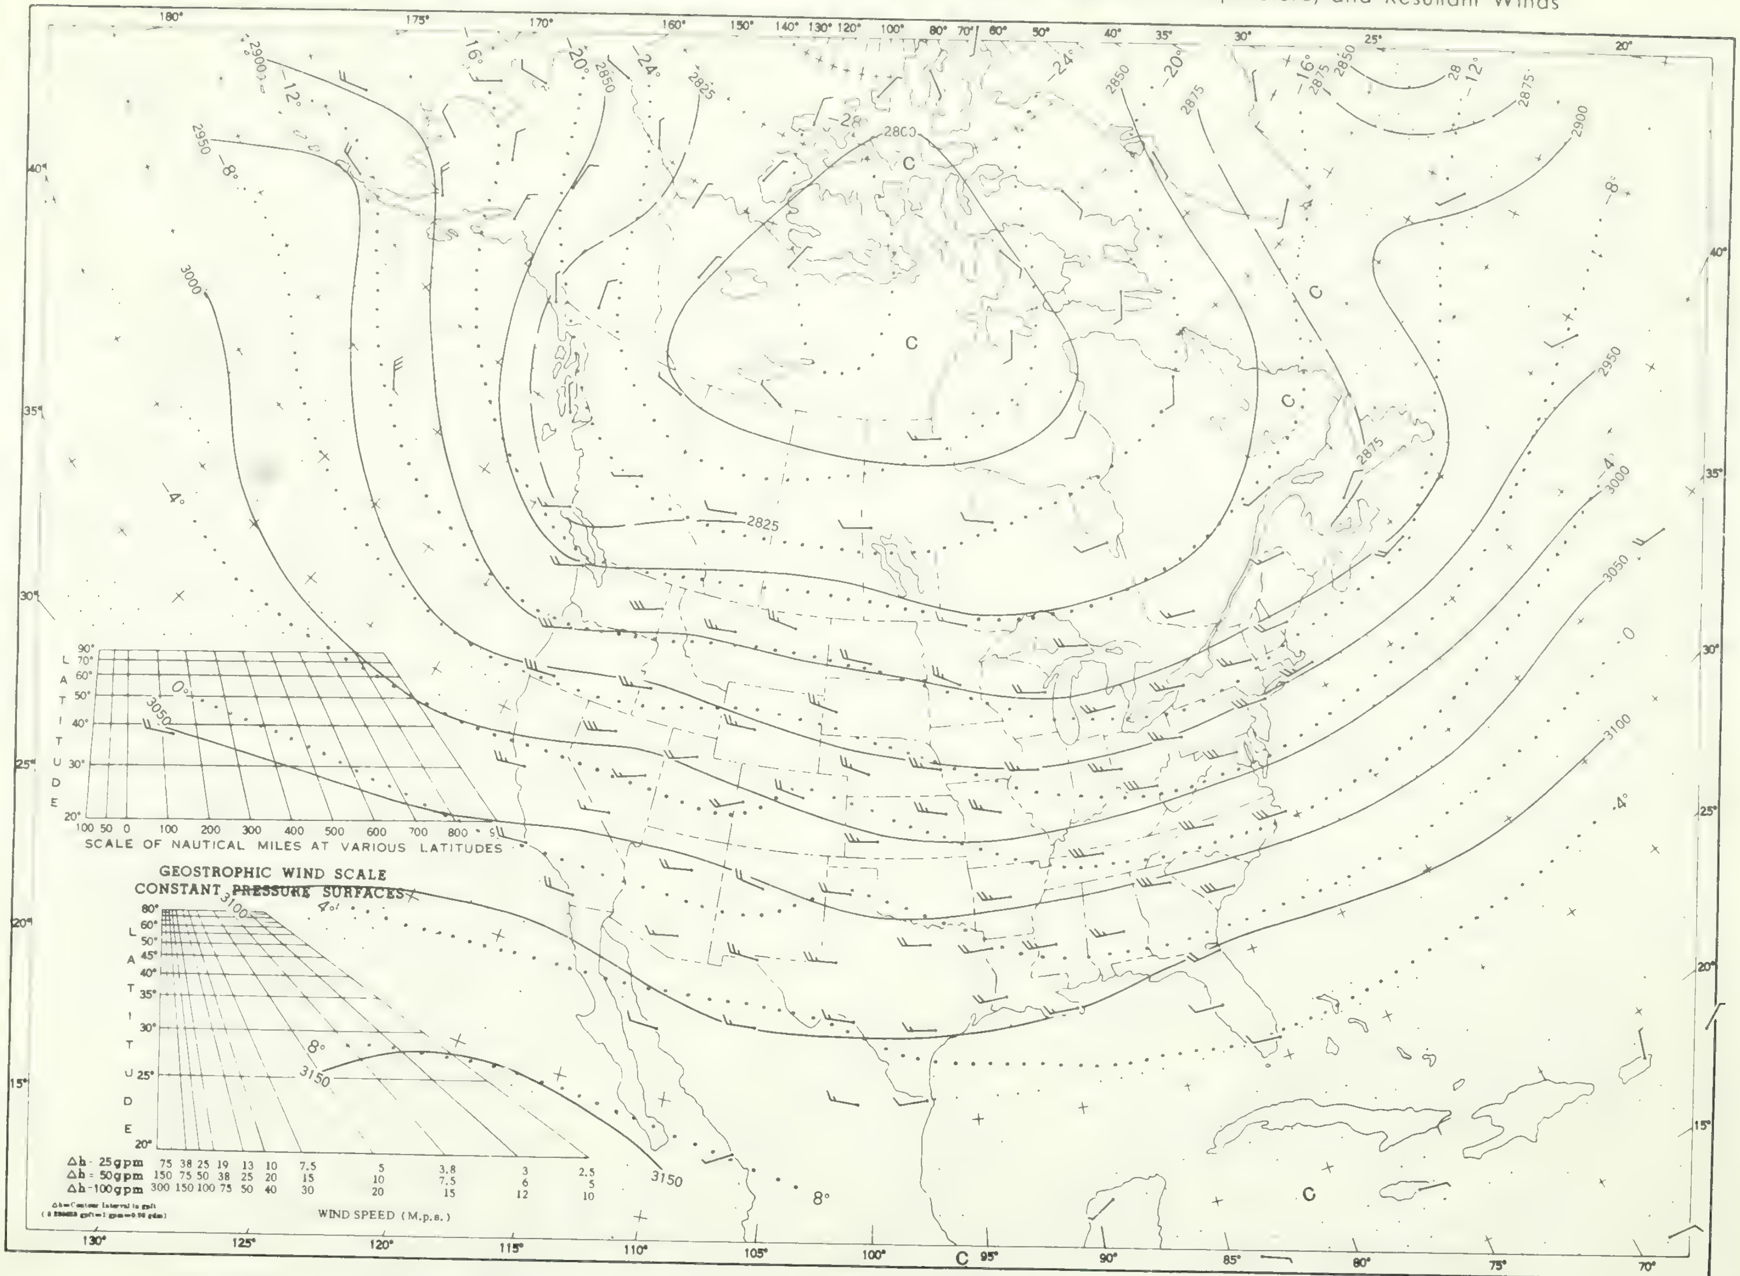
10 Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb Surface, 1200 GMT, January 1969. Average Height and Temperature, and Resultant Winds



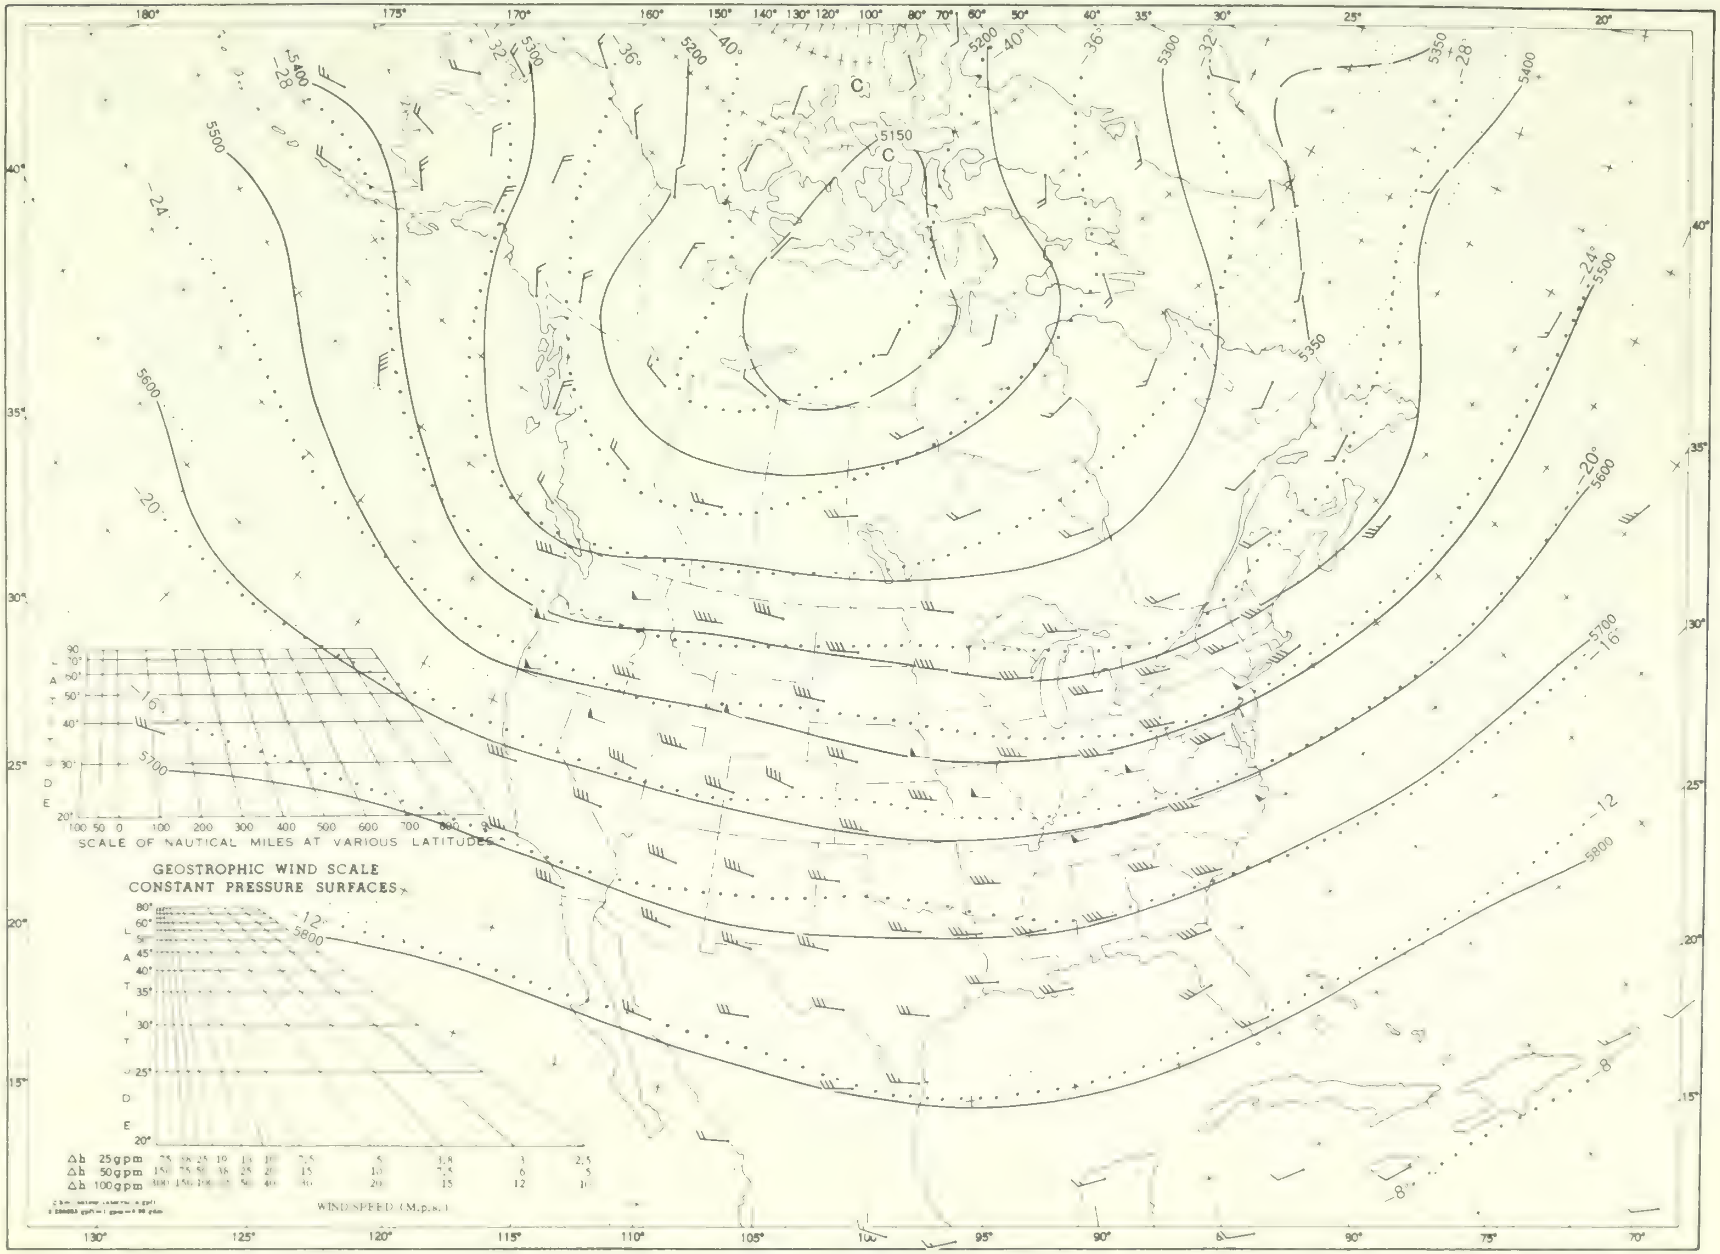
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb Surface, 1200 GMT, January 1969. Average Height and Temperature, and Resultant Winds



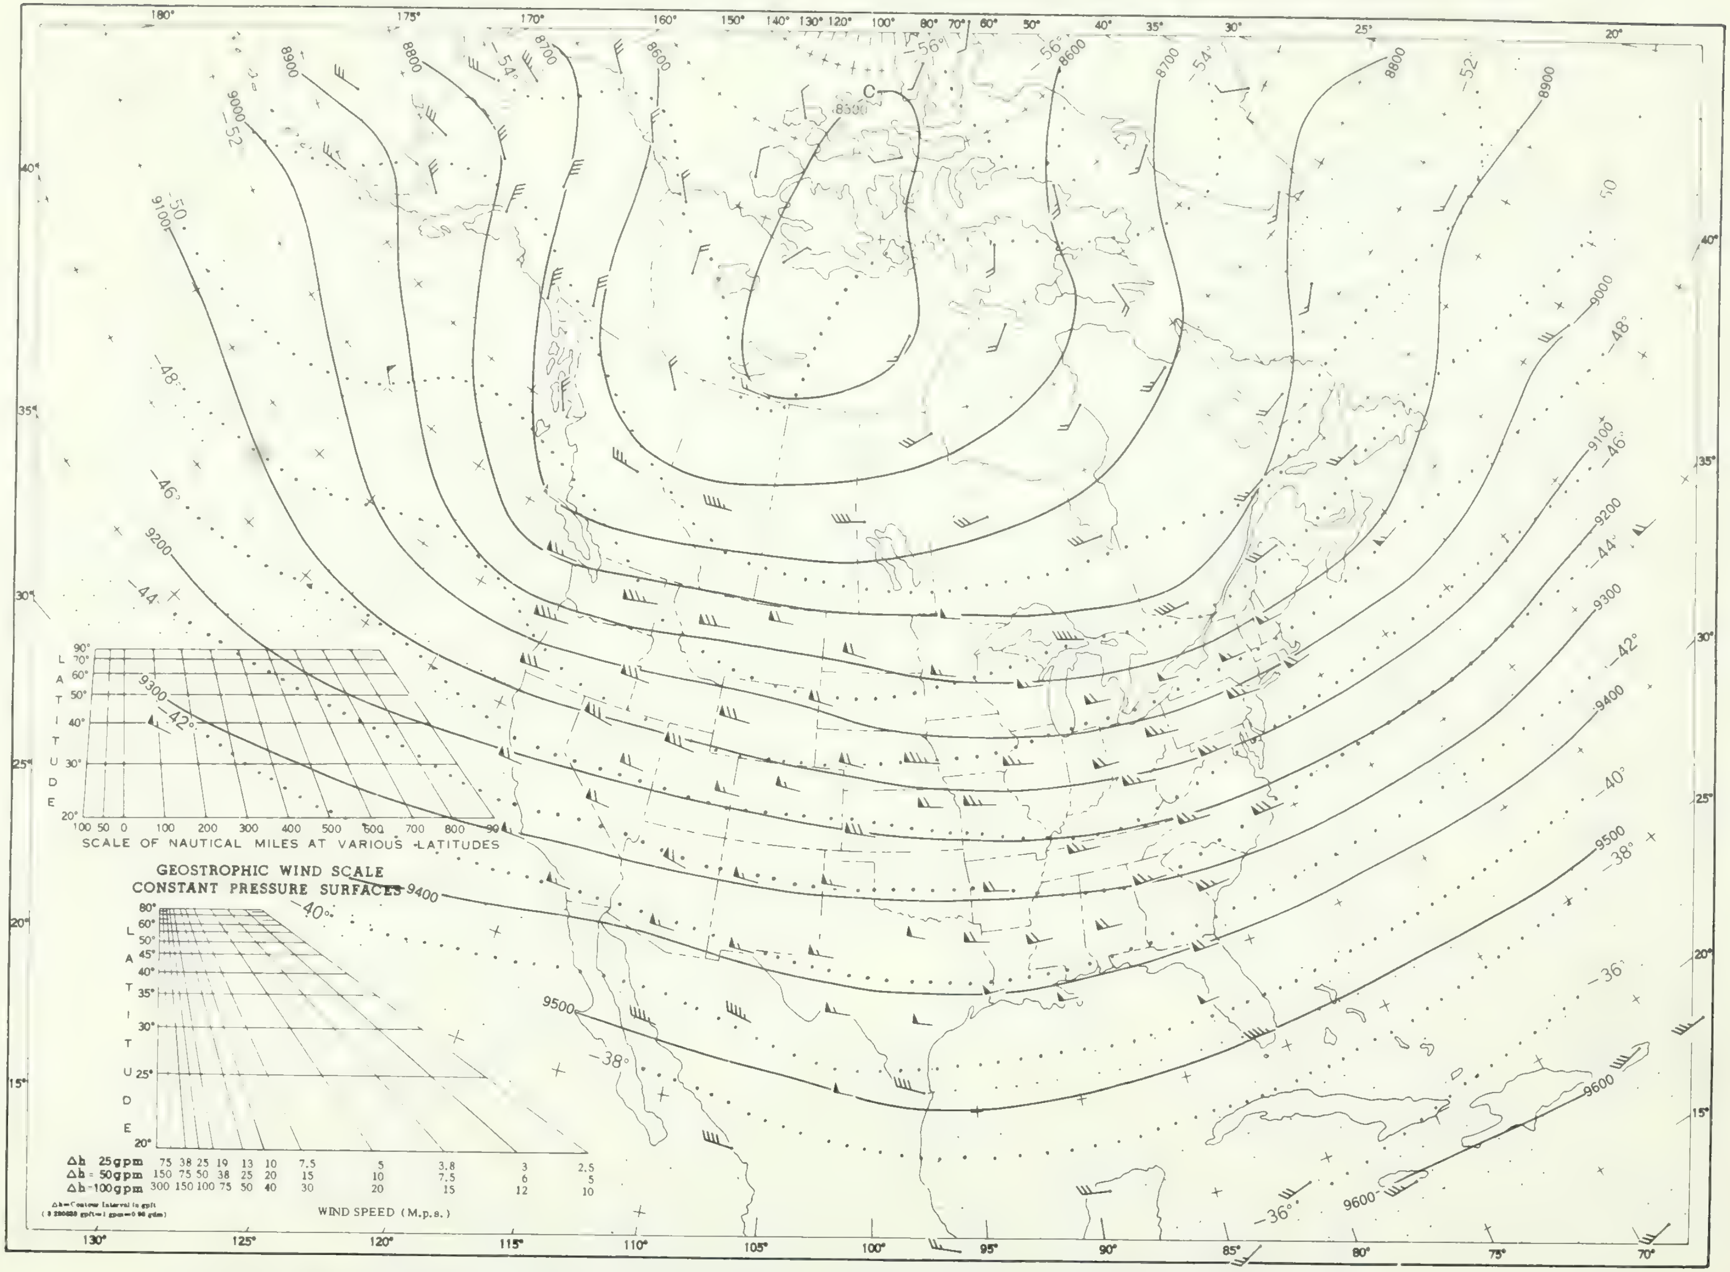
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 GMT, January 1969. Average Height and Temperature, and Resultant Winds.



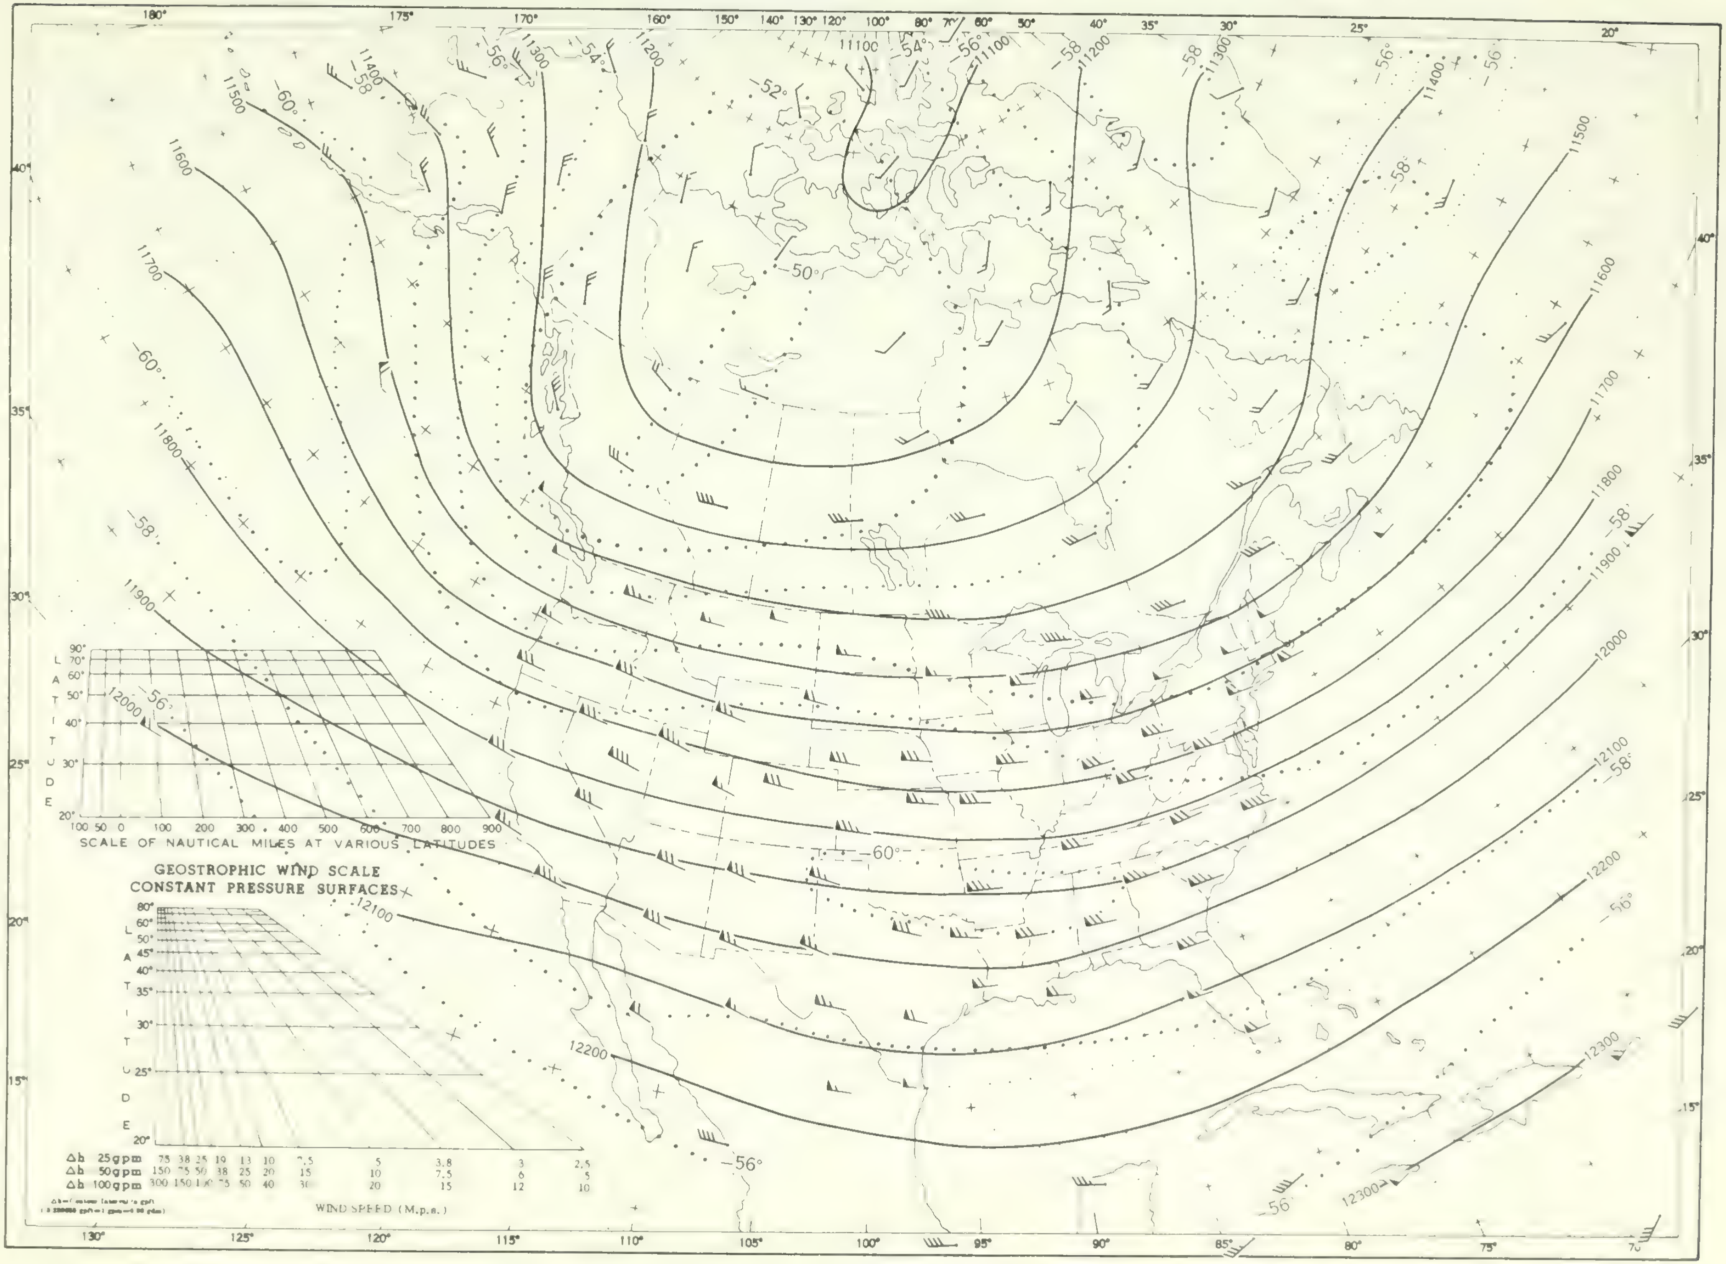
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV 300-mb Surface, 1200 GMT, January 1969. Average Height and Temperature, and Resultant Winds



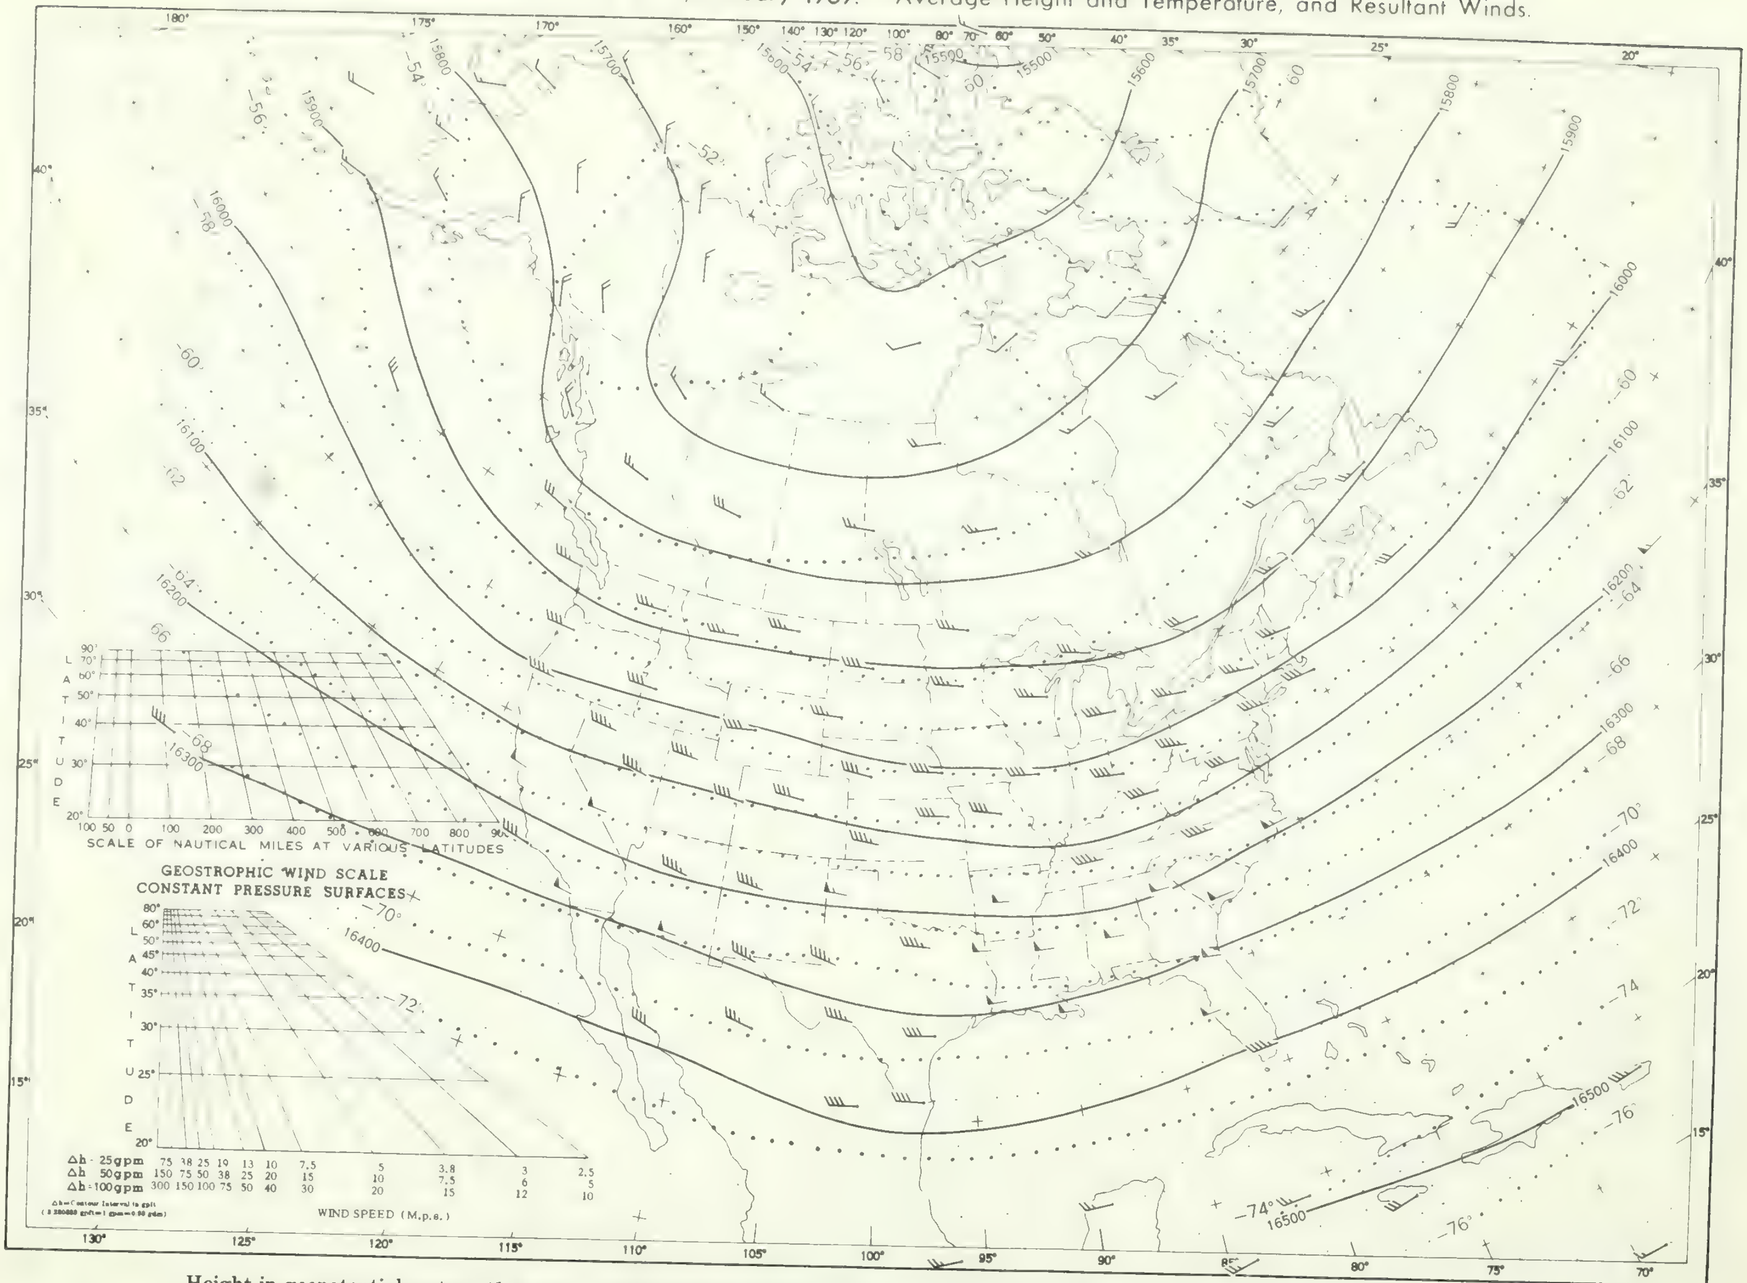
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25mps, full feather 5mps, and half feather 2.5mps. All wind data are based on rawin observations.

Chart XV. 200-mb. Surface, 1200 GMT, January 1969. Average Height and Temperature, and Resultant Winds.



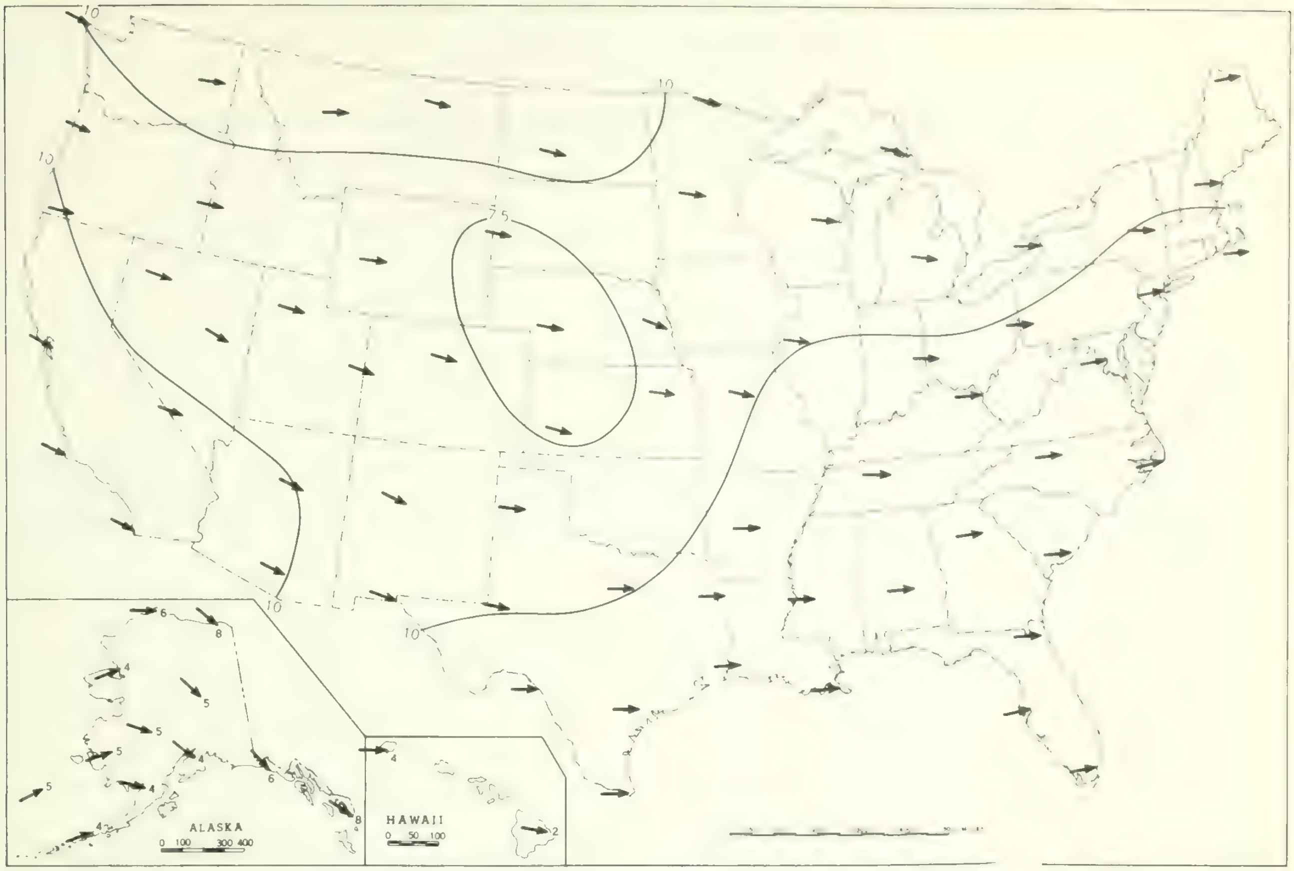
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 GMT, January 1969. Average Height and Temperature, and Resultant Winds.

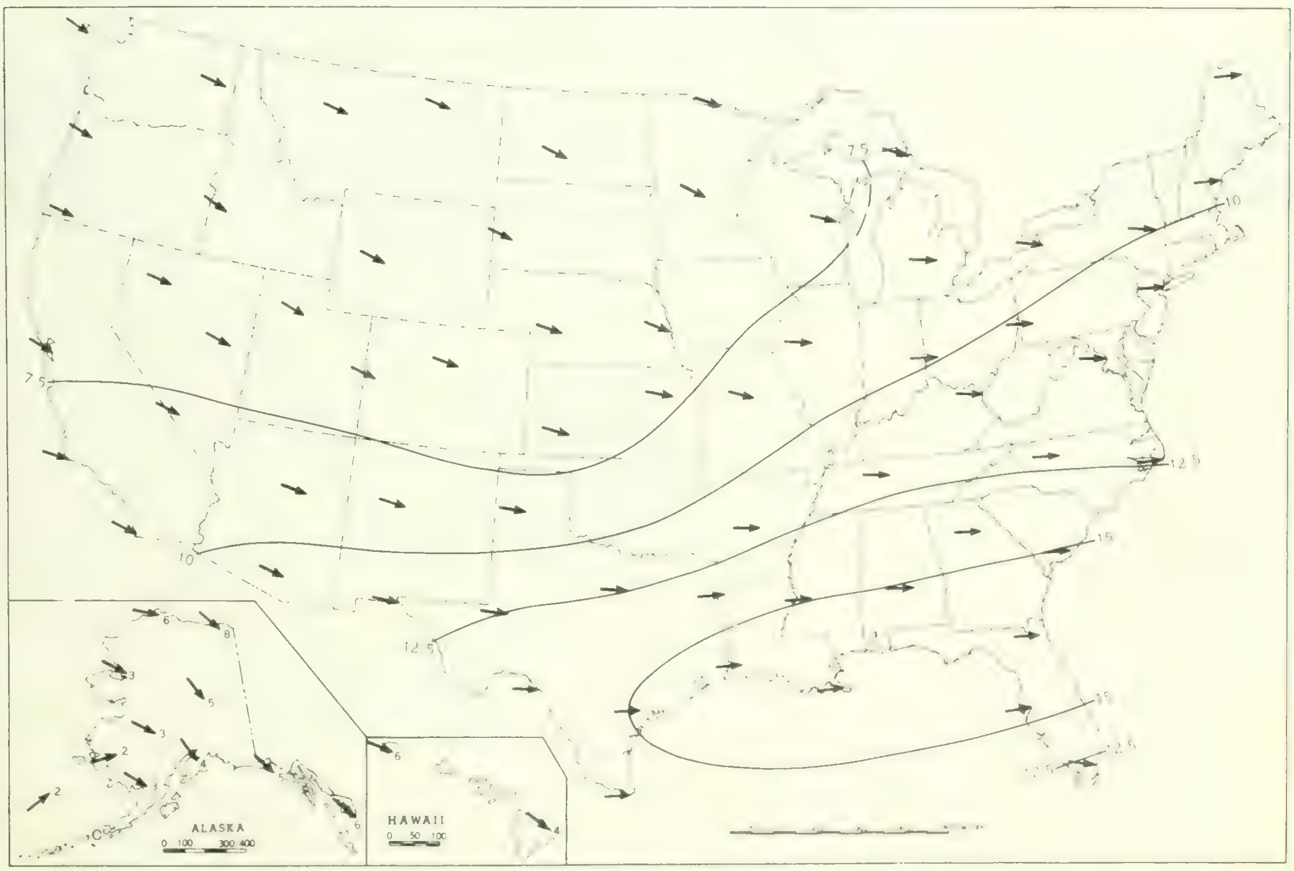


Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 GMT, January 1969. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, January 1969. Resultant Winds.



Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations

NATIONAL SUMMARY

FEBRUARY 1969
Volume 20 No. 2

Asheville 1969

C O N T E N T S

NOTE: Delayed data and corrections will be carried in the June and December issues of this publication. An explanatory page "Description of Charts" will be carried in the January and July issues.

SUBSCRIPTION PRICE: Monthly 20 cents and annual 40 cents per copy; yearly subscription, including monthly and annual issues, $2.50 domestic, $3.50 foreign. Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to "Superintendent of Documents, Government Printing Office, Washington, D.C. 20402"

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 20 No. 2 FEBRUARY 1969

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Only light sprinkles or light snow fell in portions of the Great Lakes region in February.
2. Recordbreaking heavy snowfall fell in parts of the Dakotas and Nebraska.
3. The snowpack in the Cascades and Sierras reached record or near-record depths.
4. Several severe snowstorms battered New England.

TEMPERATURE.--February temperatures averaged below normal from the Far Northwest to the western edge of the Great Plains, in California, in the Great Basin, and from eastern Texas to southern New England and southward to the Gulf of Mexico and the Atlantic Ocean. Above-normal monthly average temperatures occurred from the central and southern Rocky Mountains to New England and from the middle and eastern Canadian border to the Ohio River.

Montana averaged 3° to more than 6° colder than normal because of the persistent bitter cold weather in the last 3 weeks of February. Similarly, persistent cold in the Southeast from about the 10th to 28th more than offset the mild weather of the first week of the month.

Temperatures in the cold areas ranged widely. The extremes at Havre, Mont., were -21° on the 1st and 38° on the 9th. At Gainesville, Fla., temperatures ranged from 80° on the 2d to 33° on the 19th. In the warmer areas, the temperatures ranged much less. At Chicago, the highest temperature for the month, 42°, and the lowest, 11°, both occurred on the 4th, the monthly range, 31°. Only twice in Chicago's long record has the temperature failed to go above 42°, and in about 90% of the Februarys, the weather gets colder than 11°, but in no prior February has the small monthly range of only 31° been approached.

Subfreezing temperatures occurred in northern Florida on 1 or 2 days in each week of February. On the 5th, the temperature plunged to the upper 20's in the colder sections of central Florida. Subzero temperatures were common over the northern Great Plains and the northern and central Rocky Mountains on several days scattered through the month.

PRECIPITATION. -- February precipitation ranged widely, from less than 1/30 inch at Yuma, Ariz., to more than 9 inches at Quillayute, Wash. These extremes, however, are not impressive for those locations. Yuma receives less than 0.03 inch in February in about 2 out of 10 years and 9 inches at Quillayute is less than 3/4 of the February normal. Outstanding among the February 1969 records are such meager amounts as 0.04 inch at Green Bay, Wis., and Rockford, Ill., and 0.05 inch at Milwaukee, Wis. In no previous February had any of those stations received less precipitation. The Milwaukee record began in 1872.

At the other extreme, heavy precipitation fell from the eastern Dakotas to central and southwestern Kansas and over the South. Grand Island, Nebr., received 21.5 inches of snow in February, the 2d greatest February snowfall in their 73-year record. Sioux Falls, S. Dak., received 28.5 inches of snow in February 1969, bringing their seasonal total to 91.8 inches.

Several February storms dumped heavy snow in New England. On February 3 and 4, rain fell in southern New England and heavy snow in parts of New York and northern New England. Greenville, Maine, received 22 inches in 24 hours ending at 7 a.m. February 4, increasing the snow cover to 56 inches. Boonville, N. Y., received 8 inches on the 5th. Another storm, after leaving moderate to heavy snow over the central Appalachians on the 8th, turned northeastward dumping 15 to 20 inches of new snow on the large cities in the Northeast, becoming the worst storm in 10 years. Winds in southern New England, gusting to over 70 m.p.h., drifted the snow to depths of 6 to 8 feet. The heavy snow and blowing snow stopped both surface and air traffic and halted business and industrial activities in the major cities of the Northeast on the 10th.

Another storm, after dumping 1 to 1 1/2 feet of snow over western North Carolina on the 15th and 16th, moved far out into the Atlantic. It stalled about 600 miles east of the Virginia coast, and continued to furnish rain, freezing rain, freezing drizzle, and snow to the Middle Atlantic States and Northeast. One to 3 inches of snow fell from Washington, D. C., to New York City on the 20th. By the 26th, 2 feet of snow had fallen at Boston, Mass., and 3 feet at St. Johnsbury, Vt. In some areas the snow fell continuously for more than 100 hours and many schools remained closed from the 24th to 28th. The storm set new records for a wide area including stations in Vermont, New Hampshire, Maine, and Massachusetts.

The snowpack in the Cascades in Washington and Oregon was above normal and that in the Sierras of California neared record depth. The heavy rains in southern California caused damaging mudslides and some flooding. The deep snow in the Cascades, Sierras, New England, and the northern Great Plains from northeastern Nebraska to southwestern Minnesota increased the flood potential in those areas.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

C Crop damage
° Includes crop damage
D Data delayed

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
\# Freezing drizzle and freezing rain, commonly known as glaze.
∅ For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, ESSA, monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000
7 $5,000,000 to $50,000,000
8 $50,000,000 to $500,000,000
9 $500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

FEBRUARY 1969

Elmer R. Nelson, Office of Hydrology

The most damaging floods during February occurred in southern California for the second consecutive month. In most areas the flood damage was less than in the previous month. Mud slides were more numerous than in January. Channel flows were generally below the January level. Flooding in the Salinas Basin was more severe than in January which was the most severe since 1952. The Chowchilla and Fresno Rivers crested higher than in January. Major damage in the San Joaquin Basin was confined to the valley floor and in the lower foothill areas.

The crests on the Wabash River from LaFayette, Ind., to Mt. Carmel, Ill., were the highest in 10 years. At Mt. Carmel, Ill, the crest was the highest since 1913. Flooding along the lower White River in Indiana was the highest in 5 years at some points. The crest on the Little Wabash River at Carmi, Ill., was the second highest in the history of the station.

Lake Michigan.--Runoff in the Grand River Basin in Michigan from the January thaw entered the lower Grand River in the beginning of February. Comstock Park, just north of Grand Rapids, Mich., exceeded flood stage by about 0.8 foot. This produced limited lowland flooding. The minor lowland flooding that resulted from an ice jam in Robinson Township in Ottawa County, Mich., during the latter part of December began to subside during the first few days of February.

Lake Erie.--The St. Marys River at Decatur, Ind., rose above flood stage on Jan. 18 and continued in flood to Feb. 5. The crest on Jan. 31 was 5.4 feet above flood stage. The St. Joseph River at Montpelier, Ohio, rose above flood stage on Jan. 19 and receded within its banks on Feb. 6. The crest on Jan 31 was 4.7 feet above flood stage. The Maumee River at Napoleon, Ohio, rose out of its banks on Jan. 28 due to an ice jam at the eastern end of the city. About 25 families were evacuated. The ice jam broke on Jan. 29 after cresting 8.9 feet above flood stage. It rose above flood stage at Fort Wayne, Ind., Defiance, Ohio, and Grand Rapids, Ohio, on Jan. 30. It receded within its banks on Feb. 1-5. The crests ranged from 3.3 feet above flood stage at Grand Rapids to 6.2 feet above flood stage at Fort Wayne.

Lake Ontario.--Minor flooding occurred on Oatka Creek at Garbutt, N. Y., and on Black Creek at Churchville, N. Y., on Feb. 1. The crests were less than 0.5 foot above flood stage. Fields and pastureland were flooded to a minor extent with no observable damage.

ATLANTIC SLOPE DRAINAGE

The Susquehanna River at Vestal, N. Y., reached a stage of 18 to 19 feet (flood stage 18 feet) on Jan. 31 due to an ice jam about 1,000 feet below the gage. It receded within its banks on Feb. 1. Ice flows jammed temporarily at various points along the main stem on Feb. 1-2. Near bankfull stage was reported on the North Branch near Vestal, N. Y., due to ice jams during the same period. No damage resulted.

Light flooding occurred on the upper Neuse and lower Cape Fear Rivers in eastern North Carolina on the 3d-8th. This flooding was due to heavy rain that totalled between 1 and 2 inches on the morning of the 2d. The crests ranged from 1 to 2.5 feet above flood stage on the Neuse River to 5 to 6 feet above flood stage on the lower Cape Fear River. No damage was reported.

The Rocky River at Norwood, N. C., rose 1.1 feet above flood stage on the 4th and 0.2 foot above flood stage on the 24th. The Pee Dee River at Peedee, S. C., rose above flood stage on the 5th and continued in flood to the 13th. The crest on the 8th was 0.7 foot above flood stage. It rose above flood stage again on the 20th and continued in flood to Mar. 14. The crest on the 27th was 2.9 feet above flood stage. The Lumber River at Lumberton, N. C., continued in flood from Jan. 23 through February into March. There were four crests, with the highest crest 2.8 feet above flood stage occurring on the 27th.

The Saluda River at West Pelzer, S. C., rose 0.2 foot above flood stage on the 3d. The Broad River at Blair, S. C., was out of its banks on the 3d-5th. The crest on the 3d-4th was 4.5 feet above flood stage. This flooding was due to 1.5 to over 3 inches of rain on the 1st-3d. Little or no damage resulted from the flooding.

The Savannah River at Milhaven-Wade, Ga., rose briefly to flood stage on the 4th and 10th but did not exceed it. At Clyo, Ga., the river was above flood stage from Jan. 29 to Feb. 27. The crest on the 11th was 2.3 feet above flood stage.

EAST GULF OF MEXICO DRAINAGE

The Oostanaula River at Resaca, Ga., was out of its banks on the 3d-7th. The crest on the 5th was 5.6 feet above flood stage. The Etowah River at Canton, Ga., rose briefly above flood stage on the 3d. The crest was 0.4 foot above flood stage. This flooding was due to rainfall ranging from 2 to 3.5 inches on Feb. 1-3. There was no flooding of urban areas. Damage to farmlands and public roads along the Oostanaula was estimated at nearly $78,000.

The East Fork Tombigbee River at Fulton, Miss., was in light flood on the 2d-7th. The crest on the 3d was 2.7 feet above flood stage. The Tibbee River at Tibbee, Miss., was out of its banks on the 3d-6th. It crested on the 4th, 2.6 feet above flood stage. The main stem of the Tombigbee River rose above flood stage at Aberdeen, Miss., on the 3d and at Jackson, Miss., on the 7th. It receded within its banks at Aberdeen on the 8th and at Jackson on the 15th. The crests ranged from 2.9 feet above flood stage at Aberdeen on the 7th to 1.5 feet above flood stage at Jackson on the 10th. No appreciable damage resulted from the flooding.

The Pearl River rose above flood stage at Bogalusa, La., on the 24th and receded within its banks on the 28th. The crest on the 26th was 1.4 feet above flood stage. This overflow was due to 1.5 inches of rain on the 20th. A similar amount of rain occurred on the 15th. No damage resulted from the slight overflow.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--Precipitation during February in the Upper Mississippi Basin was generally much below normal. Most of Wisconsin, Southwestern Minnesota, and northeastern Iowa reported less than 0.25 inch during the month. In northern and central Minnesota, the average precipitation ranged from 0.4 to 0.8 inch. In southwestern Minnesota, however, 1 to 2 inches of precipitation was observed.

The snow cover in the Upper Mississippi Basin on Feb. 28, as compared with that of other years is given in the following table:

COMPARATIVE SNOW DEPTHS (INCHES)

STATION	1969	1968	1967	1966	1965	1964	1963	1962	1961	1960	1959	1958	1957	1956

The Widespread flooding in Illinois and Missouri during February was due to rainfall during the last 2 weeks of January. The heaviest rains occurred on Jan. 27-29. Some snowmelt contributed to the overall runoff, but was not a major factor. The light to moderate precipitation on Jan. 17 and Jan. 23 conditioned the soil for maximum runoff. Major flooding occurred along the lower Meramec and Big Rivers in Missouri and along the Big Muddy River in southern Illinois. The Meramec River at Pacific, Mo., crested 13.4 feet above flood stage on Feb. 1. At Eureka, Mo., the crest was 15.4 feet above flood stage. The crest of 29.7 feet at Valley Park, Mo., (flood stage, 16 feet) on Feb. 2 was the highest stage since July 1957. The Meramec receded below flood stage at all points by Feb. 3. The Big River at Byrnsville, Mo., continued in flood from Jan. 30 to Feb. 1. The crest on Jan. 31 was 7.6 feet above flood stage. The Bourbeuse River at Union, Mo., crested 4.3 feet above flood stage on Feb. 1 and receded within its banks on the same day.

In Illinois, the Big Muddy River at Murphysboro, Ill., rose above flood stage on Jan. 24 and crested on Feb. 3, 16 feet above flood stage. Upstream at Plumfield, Ill., it rose out of its banks on Jan. 31 and crested 3.4 feet above flood stage on Feb. 3. The Big Muddy River receded within its banks on Feb. 17. The Kaskaskia River at Shelbyville and Vandalia, Ill., rose above flood stage on Jan. 29 and crested 3 to 7 feet above flood stage on Jan. 31. It rose above flood stage at New Athens, Ill., on Jan 31 and crested 1.2 feet above flood stage on Feb. 3. The Kaskaskia receded within its banks at these locations on Feb. 6. It rose above flood stage at Carlyle Dam, Ill., on Feb. 3 and continued in flood to Mar. 13. The crest on Feb. 21 was 4.3 feet above flood stage. Minor flooding occurred upstream at Vandalia, Ill., on the 9-13th and at Shelbyville, Ill., on the 10th. Light overflows occurred along the Sangamon and Illinois Rivers during the latter part of January and most of February. The Sangamon River at Riverton, Ill., receded within its banks on the 17th and the Illinois River at Meredosia, Ill., on the 25th. The crest at Meredosia, Ill., was 7.5 feet above flood stage on the 10th.

Missouri Basin.--Temperatures in South Dakota and in northern Nebraska averaged near normal during February, with the first half generally below normal and the latter half above. Some thawing occurred, but there was very little runoff. Most streams remained frozen except in southern South Dakota and northern Nebraska where some channels opened. Precipitation was heavy during the month and snowfall was generally over twice normal.

The month ended with snow cover of 20 to 35 inches in eastern South Dakota; 5 to 20 inches in central South Dakota; up to 10 inches in western South Dakota and eastern Wyoming; 10 to 30 inches in northwest Iowa; and 25 to 40 inches in southwest Minnesota. The water equivalent of this snow was 6 to 10 inches in the Big Sioux and Vermillion Basins; 5 to 8 inches in the James Basin; 4 to 6 inches in the Floyd Basin in Iowa; up to 6 inches along the Niobrara and White Rivers; and up to 4 inches in the Bad, Cheyenne, Moreau, and Grand River Basins. Most of the available water is in the lower reaches of the rivers in northern Nebraska and central South Dakota.

All streams in the Elkhorn and Platte River basins in Nebraska remained frozen and snow-covered at the end of February. Snow depths as of the 28th ranged from 9 inches up to 20 inches with water equivalents ranging from 2 inches up to 6 inches. Some ice action caused Salt Creek at Roca, Nebr., to rise to a stage of 16.53 feet on the 27th. (Flood stage, 19 feet). Resulting highwater due to an ice jam caused 8 to 10 inches of water over the highway to the west of the gage on the 26th. Some local and short period minor ice jams occurred on the Boyer River in western Iowa.

Light to locally moderate flooding developed near the end of February from snowmelt in parts of the lower Big Blue River basin, and in the lower Republican River Valley. The most significant rises occurred on the Big Blue River at Beatrice, Nebr., with an overflow of over 4 feet and at Blue Rapids, Kans., where it reached nearly 5 feet above flood stage. Overflows in the lower Little Blue River Valley, the Black Vermillion River and Fancy Creek in Kansas were of brief duration and relatively minor. Local overflows in the Republican Basin at Clay Center and Jamestown, Kans., were comparatively minor. There was some overflow on the Little Blue River above Fairbury, Nebr., on the 27-28th due to an ice jam. Highway 136 was covered with about 6 inches of water, but stages returned well within banks downstream at Fairbury. Water equivalents of the snow cover were predominantly 1.5 to 3 inches in the Big Blue River basin prior to the rises at the end of the month. Little runoff was released from the locally heavier water equivalents of 3 to 5 inches on the tributaries in the headwaters. The principal snow cover at the end of the month was from 4 to 8 inches over this area from the Big Blue River southward across Lincoln Creek, Beaver Creek, and the West Fork drainages. Damages were negligible. The overflow along the Blue River channel near Beatrice, Nebr., inundated about 1,000 acres. Although highway travel was affected for a short time in the Little Blue River Valley above Fairbury, Nebr., no damages were noted.

Ice-blocking caused minor flooding on the Grand, Blackwater, and Marmaton Rivers in Missouri. The Grand River at Sumner, Mo., was out of its banks on the 7-14th. The crest on the 10th was 3.9 feet above flood stage. The Blackwater River at Valley City, Mo., rose 1.3 feet above flood stage briefly on the 6th. The Marmaton River at Nevada, Mo.; rose above flood stage on Jan. 28 and continued in flood to Feb. 4. The crest on Jan. 31 was 1.9 feet above flood stage. Some damage resulted to farmland. Local highway traffic was affected in the Sumner, Mo., area as State Highway 139 was inundated at 27 feet.

Minor flooding occurred on the South Grand River at Urich, Mo., on the 6th and on the Osage River at Schell City, Mo., on the 9th. The Gasconade River at Jerome, Mo., crested 6.5 feet above flood stage on Feb. 1. It was out of its banks from Jan. 30 to Feb. 2.

Ice jam flooding occurred along the upper Missouri River in a 12-mile stretch about 40 miles south of Great Falls, Mont., from the latter part of January to Feb. 3. U. S. Highway 91 (Interstate Highway 15) was reopened on the afternoon of the 4th after the ice was removed. Downstream at Nebraska City, Mo., ice action caused minor flooding on the 26-28th. The crest on the 26th was 1.2 feet above flood stage.

Ohio River Basin.--Minor flooding developed on the Scioto River in Ohio during the last week in January and continued until Feb. 4. The overflow was due to moderate to heavy rains on Jan. 29-30. The crest stages varied from 1 to 4 feet above stage. While some secondary roads were closed temporarily, the principal flooding was on farmland not currently in production.

Minor flooding occurred on the Rough River at Dundee, Ky., on Jan. 31 to Feb. 1. The crest on Feb. 1 was 0.35 foot above flood stage. The Green River at Calhoun, Ky., was out of its banks on Feb. 1-4. It crested on the 3d, 0.8 foot above flood stage. There was minor damage ($156,000) from the overflows. About 20,000 acres were inundated.

The prolonged cold weather and snow cover during the first 2 weeks of January set the stage for major flooding in the Wabash Basin in Indiana during the latter part of January and early February. This cold weather caused ice to cover most streams up to 1 foot thick by the middle of January and the soil to freeze to a considerable depth. Heavy rainfall (up to 5 inches) over the lower Wabash and lower White Rivers on Jan. 28-30 caused heavy runoff. The crests on the Wabash River from Lafayette, Ind., to Mt. Carmel, Ill., were the highest in 10 years. At Mt. Carmel, Ill., the crest of 28.6 feet on Feb. 6 (flood stage 17 feet) was the highest since 1913. A few smaller homes and installations between the levee and the river were flooded and evacuations were necessary. The new levees protected large areas, preventing considerable damage and eliminated the necessity of evacuating many homes. Flooding along the lower White River was the highest in 5 years at some points. A few residences in some low-lying areas on the outskirts of Indianapolis and Spencer, Ind., were surrounded. A few families were evacuated near Spencer where the water reached the floor level in a few homes. Much bottomland was overflowed and numerous roads were closed along the East Fork of the White. Flooding occurred along the Muscatatuck at Austin, Ind., from Jan. 29 to Feb. 2. The crest on Jan. 31 was 7.9 feet above flood stage. The Embarrass River in Illinois crested 5 to 7 feet above flood stage.

The Little Wabash River reached a crest of 34.6 feet (flood stage, 27 feet) at Carmi, Ill., on Feb. 5. This was the second highest stage in the history of the station. Major damage resulted to crops (principally wheat) which were inundated. Damage resulted to highways, bridges, etc. due to erosion in the lower White and lower Wabash Rivers. There was also considerable damage to oil and gas lines in that area. The total damage in the Wabash Basin was estimated at $3.5 million.

The Saline River at Harrisburg, Ill., was out of its banks from Jan. 28 to Feb. 3. The crest on Jan. 31 was 11.2 feet above flood stage. The total damage in the Saline Basin was estimated at $357,000.

Minor flooding developed on the Harpeth River at Kingston Springs, Tenn., on Feb. 2. The crest was 0.1 foot above flood stage. This flooding was due to light to moderate rain during the last week of January. Little, if any damage resulted from this overflow.

Heavy rains (2.5 to 3.5 inches) on Jan. 31 to Feb. 2 caused flooding on the South Chickamauga Creek at Chickamauga, Tenn., the Elk River at Fayetteville, Tenn., and along the main stem of the Tennessee River at and below Whitesburg, Ala. The Duck River at Shelbyville, Tenn., rose to bankfull stage on Feb. 2 but did not exceed flood stage. The South Chickamauga Creek at Chickamauga, Tenn., was out of its banks from the 1st to the 5th. It crested 7.3 feet above flood stage on the 3d. The Elk River rose above flood stage at Fayetteville, Tenn., on the 2d and continued in flood to the 5th. The crest on the 2-3d was 3.6 feet above flood stage. Crests along the main stem of the Tennessee ranged from 1.3 feet above flood stage at Savannah, Tenn., on the 7th to 10.9 feet above flood stage at Paducah, Ky., on the 10th.

The lower Ohio River rose above flood stage at Fords Ferry, Ky., on Jan. 30 and at Newburgh, Ind., Shawneetown, Ill., and Cairo, Ill., on Jan. 31. By Feb. 5 flooding was in progress from Newburgh, Ind., to Cairo, Ill., (except at Evansville, Ind.) a distance of more than 200 miles. The crests on Feb. 2-12 ranged from 1 foot above flood stage at Cypress, Ind., to 11.2 feet above flood stage at Fords Ferry, Ky. Flooding continued until Feb. 19 at Cairo, Ill. The total damage along the lower Ohio River was estimated at $607,000.

White Basin.--Heavy rains during the last 4 days in January caused extensive flooding that continued into February on the White, Black, Cache, and Ouachita Rivers. The lower White River from Georgetown to St. Charles, Ark., and the Cache River at Patterson, Ark., remained above flood stage all of February. The lower Black River crested 7.3 feet above flood stage at Pocahontas, Ark., on the 3d. At Black Rock, Ark., the highest crest occurred on Jan. 31 and was 13.7 feet above flood stage. The crests on Feb. 3 and Feb. 24 were 12.6 and 0.8 foot above flood stage respectively. The White River crested 8.5 feet above flood stage at Newport, Ark., on the 1st. Below Newport, the crests were generally 5 to 6 feet above flood stage.

Arkansas Basin.--The Illinois River at Tahlequah, Okla., rose above flood stage on Jan. 30 and receded within its banks on Feb. 1. The crest on Jan. 31 was 8.1 feet above flood stage. Minor flooding occurred on the Fourche Maline River at Red Oak, Okla., on the 22d. The Poteau River rose briefly above flood stage at Poteau, Okla., on the 22d. The crest was 0.75 foot above flood stage. At Panama, Okla., the crest was 5.3 feet above flood stage on the 22d. It was out of its banks on the 22d-24th. The Petit Jean River at Danville, Ark., rose above flood stage on Jan. 30 and crested on Jan. 31, 3.9 feet above flood stage.

It receded within its banks early in February. There were two rises on the Fourche LaFave River at Houston, Ark., during February. The first occurred on Jan. 30 to Feb. 6 and the second on Feb. 23-24. The higher crest occurred on Feb. 1 and was 13.4 feet above flood stage. Due to the location of the overflows and the non-growing season, no flood damages resulted.

Red Basin.--The flooding in streams in northeastern Texas and southwestern Arkansas during the latter part of January and the first part of February was due to heavy rains on Jan. 29. Extensive flash flooding occurred in the Saline, Ouachita, and Caddo River basins in Arkansas during the night of Jan. 29 and the morning of Jan. 30. The Saline River at Silver Ridge, Ark., rose rapidly to a crest of 17.7 feet, 1.7 feet above flood stage on Jan. 30. It receded within its banks on Feb. 2. The Ouachita River rose above flood stage on Jan. 30 in the reach from Rockport to Camden, Ark. The crests ranged from 11.5 feet above flood stage at Arkadelphia, Ark., to 14.1 feet above flood stage at Rockport, Ark. The flooding continued until Feb. 13 at Camden, Ark.

The Little River rose above flood stage at Idabel, Okla., on Jan. 30 and at Horatio, Ark., on Jan. 31. The crests ranged from 2.3 feet above flood stage at Idabel, Okla., on Feb. 1 to 5.4 feet above flood stage at Horatio, Ark., on Jan. 31.

Rapid rises occurred on the Sulphur River to above flood stage at Hagansport, Tex., and Naples, Tex., on Jan. 30 and Feb. 1, respectively. The crests averaged around 9 feet above flood stage on Jan. 31 and Feb. 3. The Sulphur River receded within its banks at Hagansport on Jan. 5 and at Naples, Tex., on Jan. 11. There were two additional rises to above flood stage at Hagansport, Tex., on the 14-18th and 20-26th. The crests were 6 feet above flood stage on the 15th and 8.1 feet above flood stage on the 22d. At Naples, Tex., the Sulphur rose above flood stage on the 20th and continued in flood to Mar. 4. The crest on the 25th was 6.6 feet above flood stage.

The Little Missouri River at Boughton, Ark., rose above flood stage on Jan. 31 and continued in flood into February. The Saline River at Benton, Ark., rose 11 feet above flood stage on Jan. 30 and continued in flood into February.

The Blue River at Blue, Okla., rose 3.5 feet above flood stage on the 22d and receded within its banks on the 23d. The Clear Boggy at Caney, Okla., was out of its banks on the 22d-25th. The crest on the 22d was 2.6 feet above flood stage. The Kiamichi rose above flood stage at Belzoni, Okla., on the 21st and receded within its banks on the 24th. It crested on the 22d, 5.4 feet above flood stage.

Lower Mississippi Basin.--The flooding on the St. Francis River was due to heavy rains near the middle of January. It rose above flood stage at St. Francis, Ark., on Jan. 23 and continued in flood to Feb. 20. It crested on Feb. 3, 4.8 feet above flood stage. Upstream at Fisk, Mo., it rose above flood stage on Jan. 29 and continued in flood to Feb. 16.

The lower Mississippi River rose above flood stage at Caruthersville, Mo., on Feb. 2 and continued in flood to Feb. 19. At New Madrid, Mo., it was out of its banks on Feb. 3-18. The crests ranged from 3 to 4 feet above flood stage on the 13-14th.

Atchafalaya Basin.--The Atchafalaya River at Morgan City, La., rose above flood stage on Feb. 22 and continued in flood into March.

WEST GULF OF MEXICO DRAINAGE

The Calcasieu River at Hineston, La., rose above flood stage on the 23d and continued in flood to the end of the month. The crest on the 24th was 2.65 feet above flood stage. It rose 2 feet above flood stage at Kinder, La., on the 28th.

Minor flooding occurred on Lake Fork Creek at Quitman, Tex., on the 1st-4th and on the 22-25th. The higher crest occurred on the 24th and was 1.1 feet above flood stage.

Violent thunderstorms on the 13th and 14th accompanied by strong east and southeast winds produced high tides and the greatest destruction since hurricane Carla along the upper Texas coast. Wind gusts reached 100 m.p.h. at High Island, while tides up to 9 feet were reported at Kemah on Galveston Bay. Bayshore property damage was estimated in excess of $5.75 million, including damage to piers, boats, and shore property. Tidal influence on the 14th extended up the Trinity channel past Moss Bluff, Tex., where minor overflow occurred. Minor flooding also occurred on the Navasota near Easterly, Tex., on the 17th and 18th from heavy rains on the 13th and 14th. Following the heavy rains of the 21st and 22d, sharp rises and lowland flooding occurred in the lower reaches of the Sabine, Neches, Trinity, and Navasota Rivers. Flooding continued into March along all rivers except the Navasota. The San Jacinto River at Lake Houston, Tex., exceeded the spillway elevation all month with the highest level being 46.66 feet on the 23d. Spillway elevation is 44.5 feet. No damage resulted from the minor overflows.

The heavy rainfall (2 to 4 inches) on the 14th in south-central Texas caused minor flooding along the Navidad and Guadalupe Rivers. Additional heavy rainfall (up to 5 inches) on the 20th and 21st resulted in light flooding on the Lavaca at Edna, Tex., and on the Navidad at Ganado, Tex. The flooding was generally in the lowlands and no damage was reported.

Heavy local rain of up to more than 11 inches during the night of the 13th in the Odem-Edroy-St. Paul, Tex., area resulted in brief heavy flooding of fields and roads. Serious damage resulted to agricultural land, terraces, and waterways. Flooding of streams from Agua Dulce Creek northeastward to the Aransas River occurred through the 15th. Major flooding occurred in the town of Odem on the morning of the 14th and on Chiltipin Creek at Sinton, Tex., during the afternoon and early night of the 14th. Flood waters entered an estimated 75 homes in Odem and 300 homes in Sinton. Water was 2.5 to 3 feet deep in hangars at the Sinton Airport. Minor flooding from local runoff occurred along the Nueces River below Wesley Seale Dam on the 14th and 15th. Four persons were drowned when an automobile went into Agua Dulce Creek 10 miles east of Bishop on the 15th. Heavy rains of up to 4 inches over the Atascosa Basin on the 13th and early morning of the 14th caused minor flooding at Whitsett, Tex., on the 16th.

GULF OF CALIFORNIA DRAINAGE

Colorado Basin.--Minor flooding occurred along the Virgin River in Arizona and Nevada due to heavy precipitation on the 24-26th. The heaviest flow came from the Beaver Dan Wash. Some farmland was lost due to channeling. There was further damage to the dam at Bunkerville, Nev., and some to the irrigation systems.

PACIFIC SLOPE DRAINAGE

Recurring heavy rains occurred in southern California for the second consecutive month. In most areas the February flood damage was much less than in the previous month since much of the erosion, silting, and inundation had already occurred. However, some areas were harder hit than in January. In the Santa Clara River Valley an estimated $4 million damage resulted to the Ventura Marina and to anchored boats. The Ventura golf course and agriculture and petroleum industry installations along the Santa Clara River sustained heavy damage. An estimated $8 million flood damage was sustained in Ventura County during February. In Los Angeles, San Bernardino, Riverside, and Orange Counties, several foothill communities had to evacuate many homes. Some homes were destroyed due to erosion, flooding, or inundation.

Mud slides were more numerous in southern California during February than during January. The saturated soil was deluged with an additional 8 to 12 inches of precipitation during February in the lowlands, and 20 to 25 inches in the mountain areas. Rainfall intensities were mostly moderate to heavy with some exceptions. In the San Gabriel Mountains, Opids Camp recorded 13.48 inches in 24 hours and Cogswell Dam, 12.55 inches. The greatest storm total for the period Feb. 20-26 was 24 inches at Arrowhead where a part of the precipitation fell as snow (three feet of snow accumulated on the ground). Some seasonal precipitation totals for the period July 1, 1968 through February 1969 were in excess of 75 inches in mountain areas.

Channel flows were generally below the January 1969 levels. Preliminary peak flows by the Corps of Engineers and the Geological Survey at a few random locations were as follows:

River	Peak Flow February c.f.s.	Peak Flow January c.f.s.
Ventura	50,000	55,000
Santa Clara	150,000	165,000
Los Angeles	70,000	110,000
Santa Ynez (Lompoc)	80,000	100,000
Santa Ynez (Chachuma Res.)	60,000	80,000
Mojave:		
Hesperia (nr)	40,000	---
Victorville (nr)	37,000	---
Barstow (nr)	30,000	---

Property damage from the flooding during February was estimated at near $50 million. This is in addition to the $125 million damage sustained in the January flood. Both estimates include physical property damage, both public and private, as well as emergency costs for crews, equipment, and materials, and business and wage losses. Fourteen deaths resulted from causes directly attributable to the flood. Of these, five persons were drowned and nine persons lost their lives by mud slides.

Salinas Basin.--Severe flooding occurred on the Salinas River in California for the second consecutive month. The flooding during February was more severe than in January which was the most severe since 1952. During February, the peak flow at Bradley, Calif., was almost double the January peak. The crest at Bradley was 20.3 feet on Feb. 24 which was 1.4 feet higher than in January. Flood stage at this point is 15 feet. On the eastern tributaries east of Paso Robles, Calif., the flow according to the Geological Survey was more than double that in January. Flash flooding was also reported on some of the west side tributaries from Lockwood to Santa Margarita. There was some new flooding from San Lucas to Spreckles. This volume of water was large enough to cause a higher flow at Spreckles than in January and more extensive flooding from Spreckles to the ocean.

There was considerable scouring from Bradley to Spreckles which increased the flow. The crest at Spreckles was 26.5 feet on the 26th which was 0.4 foot higher than in January. Flood stage is 23 feet.

The rainfall that caused this flood was the heaviest in the basin upstream from King City. The storm rainfall from 8 a.m. on the 23d to 8 a.m. on the 24th beginning in the headwater were as follows: San Margarita, 8.36 inches; Paso Robles, 4.32; Lockwood, 3.09; Soledad, 3.01, and Salinas, 2.23 inches.

The damage from this flood is difficult to assess because the flood damage during the previous month was so extensive. There was considerable new flood damage in two areas. A large percentage of the total damage during February was in the sector from Spreckles westward to the ocean where there was practically no damage during January. The other sector was from San Lucas, Calif., to beyond Paso Robles where the flooding during February was more extensive than during January. The total additional flood damage during February will be in the millions of dollars.

San Joaquin Basin.--Heavy storms continued over the San Joaquin Basin during February. Precipitation for the month averaged over 200% of normal with several stations reporting over 300%. Storms were generally of the cold type which added substantially to the already near record snowpack in the southern Sierra Nevada. Snow depths and water equivalents reported by the California Department of Water Resources have exceeded all recorded values in the higher elevation stations.

Flooding occurred for the second consecutive month in the San Joaquin Basin. The uncontrolled foothill streams overflowed agricultural lands. Irrigation canals were filled beyond capacity by foothill runoff. The communities of Cutler, Orosi, Yettem, Woodlake, and Lindsay were again severely affected. There was considerable flooding within metropolitan Fresno, but not as extensive as in January. Poso Creek overflowed a larger area, causing considerable damage in the communities of McFarland, Delano, and Earlimart. Caliente Creek in the extreme southern end of the valley overflowed through the communities of Edison and Lamont. On the west side of the valley, the communities of Avenal and Coalinga were isolated by floodwaters from the coastal mountains. The Chowchilla and Fresno Rivers crested higher than in January. There was considerable flooding from the Fresno River in the city of Madera. Success Reservoir on the Tule River was filled to near capacity on the 26th and again on the 28th.

The Tuolumne River at Modesto, Calif., was above flood stage from the morning of the 25th to the afternoon of the 27th. The crest was 0.9 foot above flood stage. Only minor flooding occurred in the areas that had been extensively flooded in January.

The main stem of the lower San Joaquin River at Vernalis, Calif., remained above flood stage from Jan. 22 to Mar. 14. The crest on Jan. 27 was 0.3 foot above flood stage. Serious levee erosion resulted from the record duration of above flood stage. Constant patrol of levees was required. About 1,700 acres of farmland and roads were flooded near Patterson and Vernalis, Calif. These areas are likely to remain

flooded until low summer flows are reached, curtailing farm operations until well into the summer.

Major damage during February was confined to the valley floor and in the lower foothill areas. In these areas the damages were as heavy and in some cases heavier than in January. The floods of January and February followed so closely on one another that assessments of flood damage during the first flood was not completed before the second flood arrived. The total loss from flooding in the California counties of Merced, Madera, Mariposa, Fresno, Kings, Tulare, and Kern during January and February was estimated at over $68 million of which probably one-half of it occurred during February. Along the main stem of the San Joaquin, and the Tuolumne, the Corps of Engineers estimated an additional damage of $0.5 million during February or $6.5 million during January and February. The total damage in the entire basin will come close to $75 million for the 2 months.

Sacramento Basin.--The high stages in January continued through February with seven additional crests moving down the Sacramento. Overflow occurred for 9 consecutive days at Moulton Weir, 26 days at Colusa Weir, and the entire month at Tisdale and Fremont Weirs. No new areas were flooded, and except at the weirs, no flood or danger stages were reached. All bypass islands remained flooded the entire month and normal agricultural operations were impossible. Farming operations will likely be delayed several months beyond the usual spring starting time in the bypass areas.

Sherman Island remained flooded through February. The water level is being lowered about 0.1 foot per day by use of pumps. None of the gas wells have been placed in production and farm operations are not possible. Asparagus plants, still under water, will have to be replanted. All dwellings on the island, about 100, were destroyed beyond repair.

Coquille Basin.--Rain and snow were prevalent over the basin during the first half of the month. Much of the heavier rains were concentrated along the coast and over the coastal mountains. Flow along the main streams responded to the rainfall and limited snowmelt with rises generally about the 9th and again on the 11th. The South Fork Coquille River at Myrtle Point, Oreg., crested 1.2 feet above flood stage on the 9th and 0.1 foot above flood stage on the 11th. Only minor damage resulted from the overflows.

Columbia Basin.--The month of February was generally cold and dry throughout the Columbia Basin. The only exceptions were northeastern Washington (125%), southeastern Oregon (125%), and southwestern Idaho (140%), where above average precipitation was reported.

Heavy precipitation on the 8th caused Johnson Creek at Sycamore, Oreg., to crest 0.1 foot above flood stage, briefly, late on the 8th. Near bankfull stages resulted on the South Yamhill and Pudding Rivers. A second storm system with freezing levels up to 7,000 feet moved through western Oregon and Washington on the 10th and 11th. Precipitation was confined primarily to the central coast range of Oregon.

Only the South Yamhill, Pudding, and Tualatin Rivers received sufficient rainfall to cause flooding. The South Yamhill at Whiteson, Oreg., crested 2.9 feet above flood stage on the 11th. The Pudding River at Aurora, Oreg., reached flood stage on the 12th but did not exceed it. The Tualatin River at Farmington, Oreg., was slightly out of its banks on the 13-15th. The crest on the 14th was 0.2 foot above flood stage.

Streams east of the Cascades had mostly only minor rises. Locally moderate thundershowers and snowmelt caused runoff and near-flood conditions in the community of Mesa, Wash., from a rapid rise in Esquatzel Coulee.

Preliminary estimates of flood damage in the Willamette Basin tributaries was placed at $87,000 by the Corps of Engineers.

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G.C.T.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun.

HM Moderate haze

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	-34	-66	-39	-36	-20	-34	-49	-40	-30	-19	-6	-34	-50	-55	-51	-58	-15	-39	-4	-32	-58	-31	-39	-15	-22	-47	-53	-59				-37

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the ESSA, Weather Bureau.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (< 3900 Å) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	11.84	8.98	12.53	13.22	10.85	1.97	3.09	8.09	12.14	12.33	11.54	13.12	10.85	6.11	10.65	13.02	14.50	11.84	8.88	9.87	4.63	2.86	5.62	6.71	11.25	11.35	3.45	7.50				9.24

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the ESSA, Weather Bureau.

TOTAL OZONE DATA

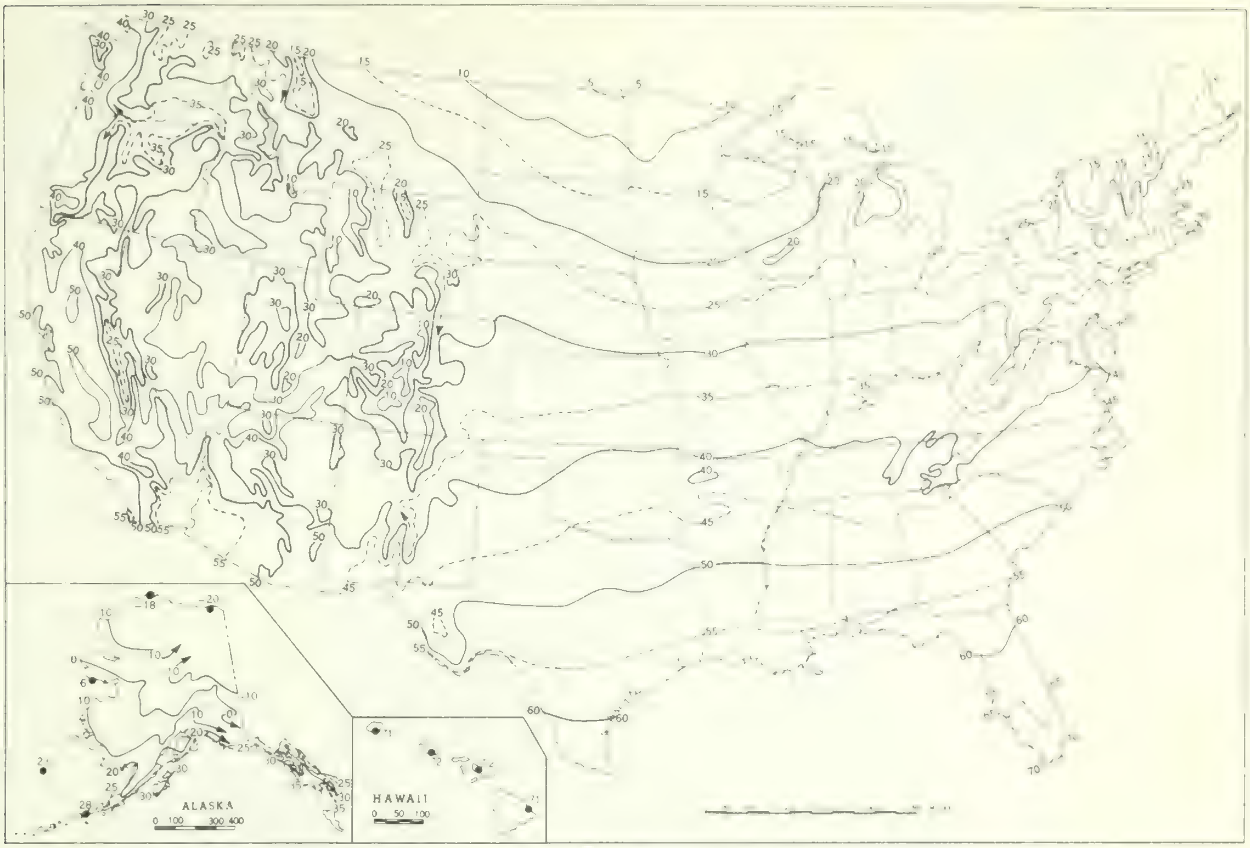
These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λs Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units Milli-atmo-cms.

Station	Day of month																															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), February



B. Temperature Departure from 30 - Year Mean (°F 1931-60), February 1969.

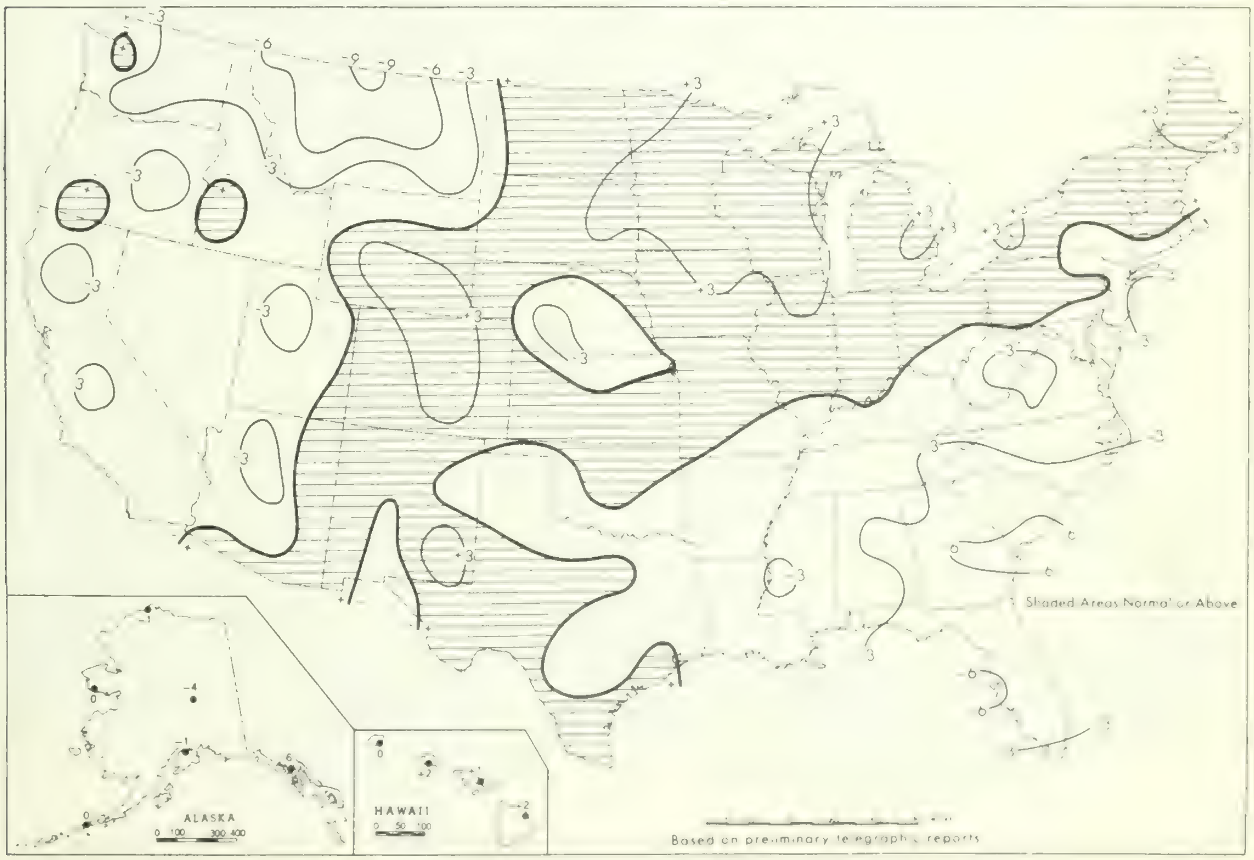


Chart II. Total Precipitation (Inches), February 1969.

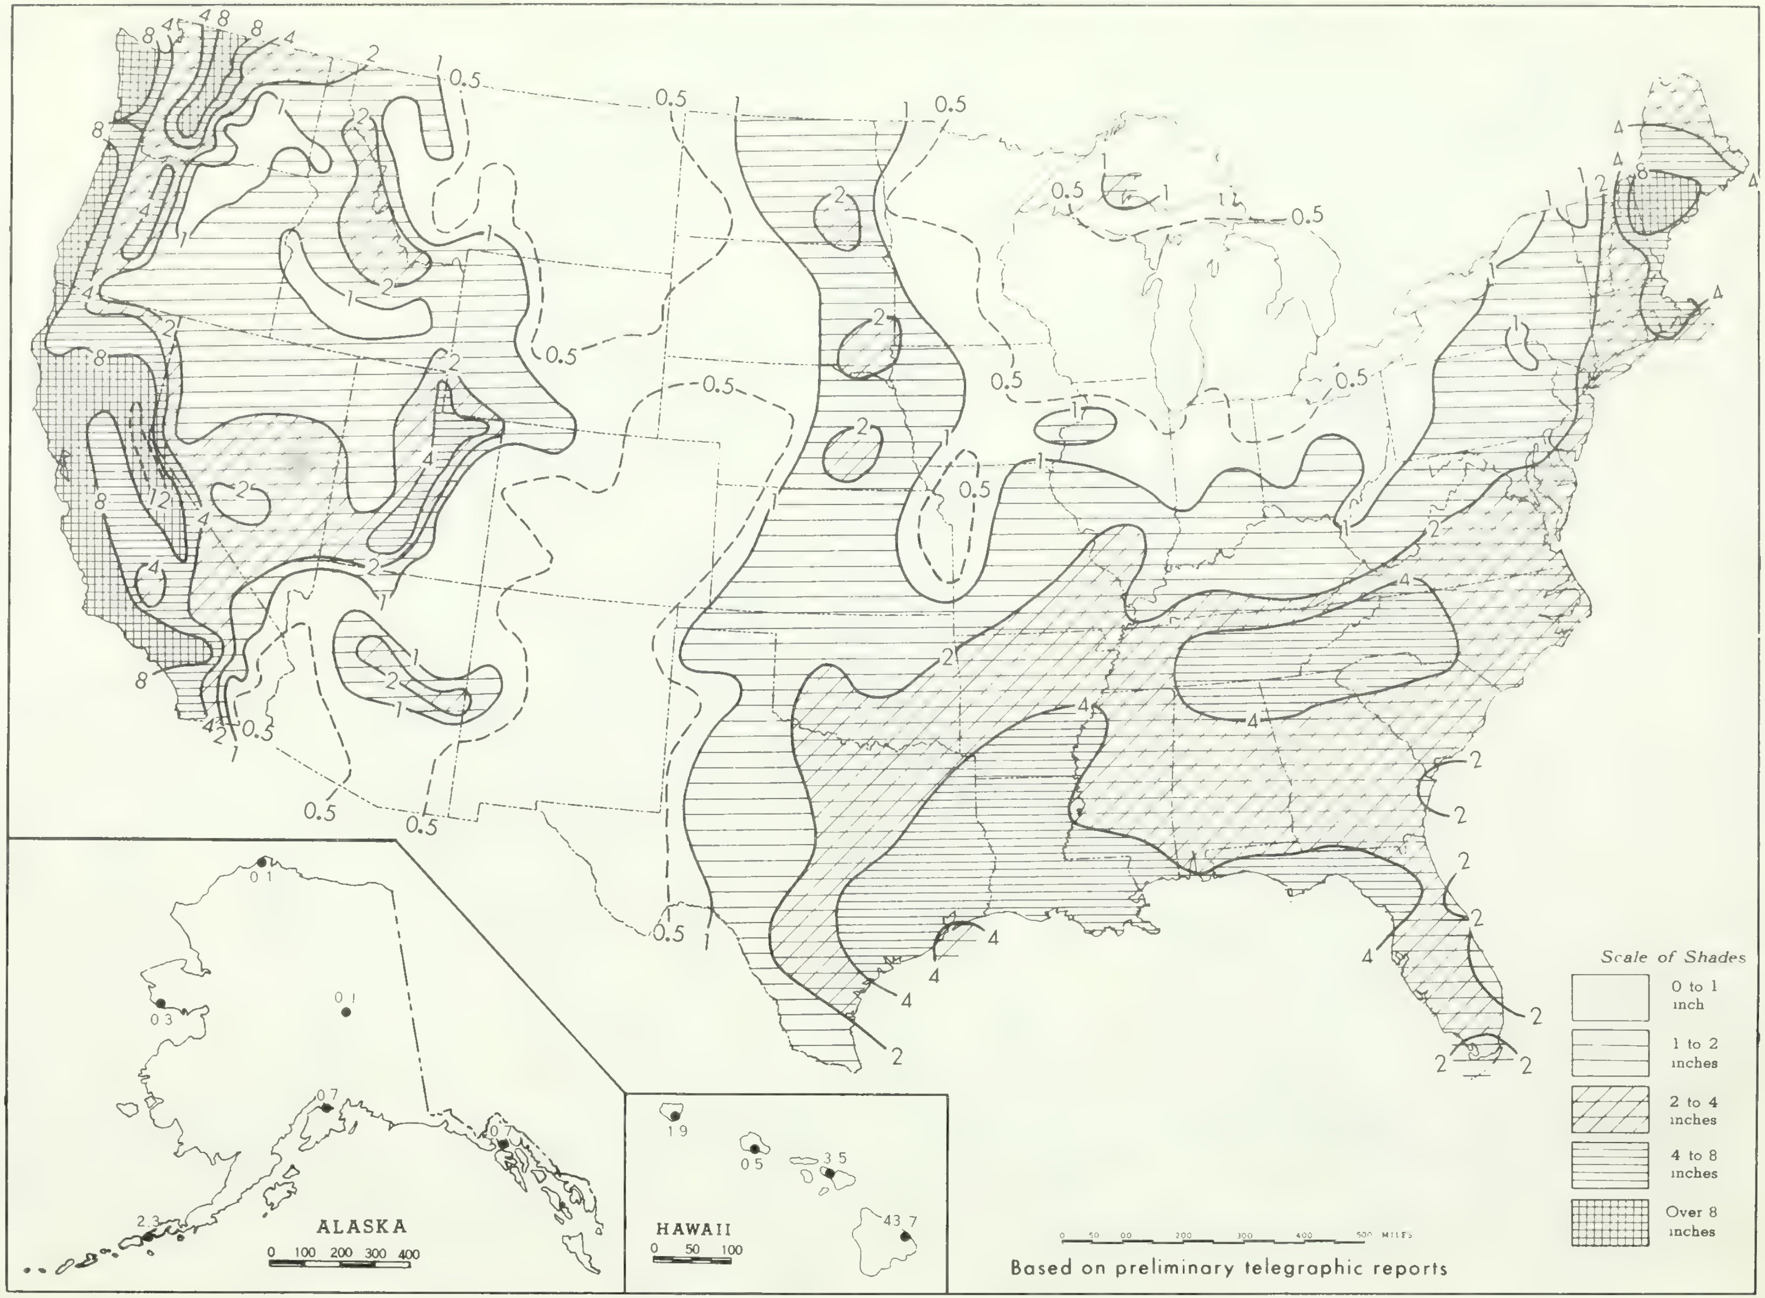

Chart III. Percentage of Normal Precipitation, February 1969.

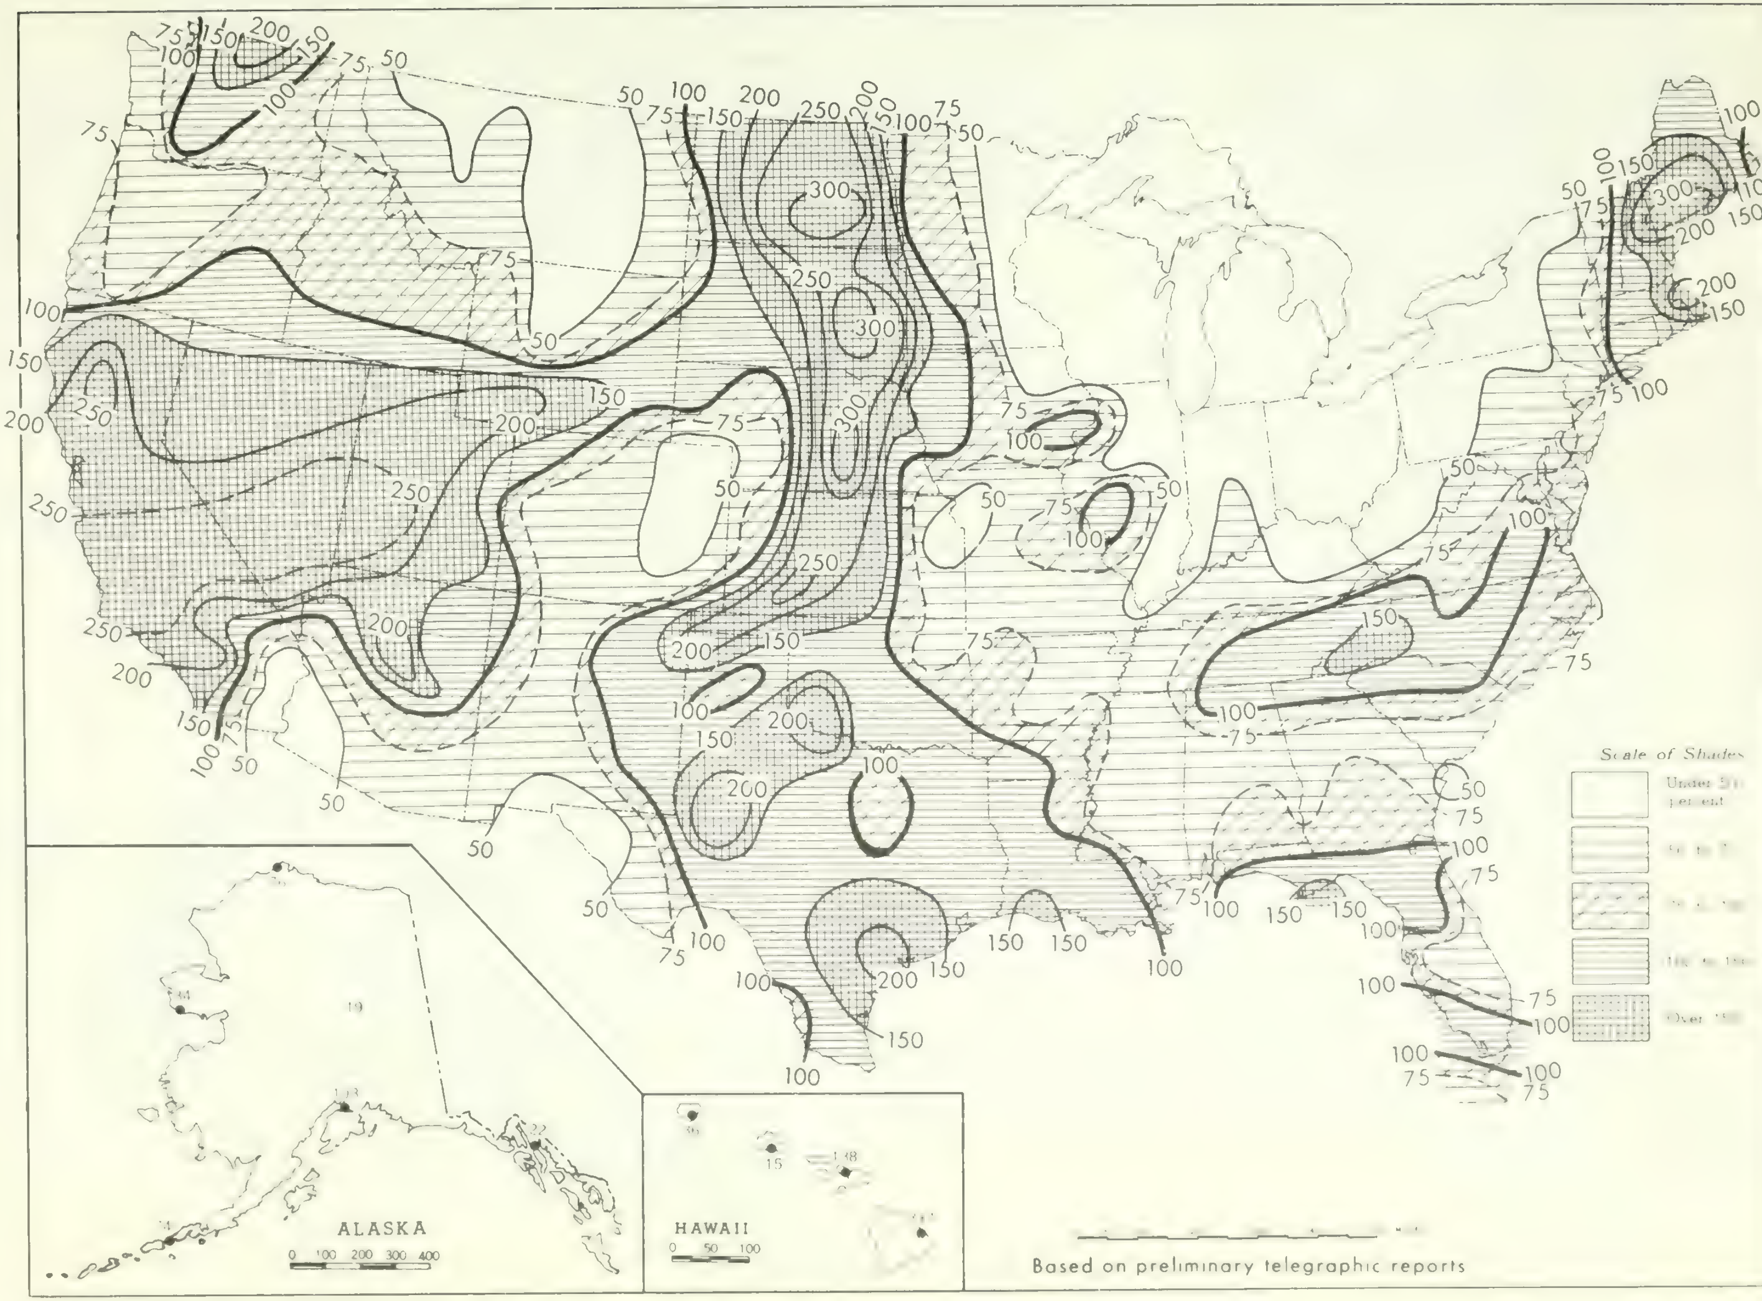

Chart IV. Total Snowfall (Inches), February 1969.

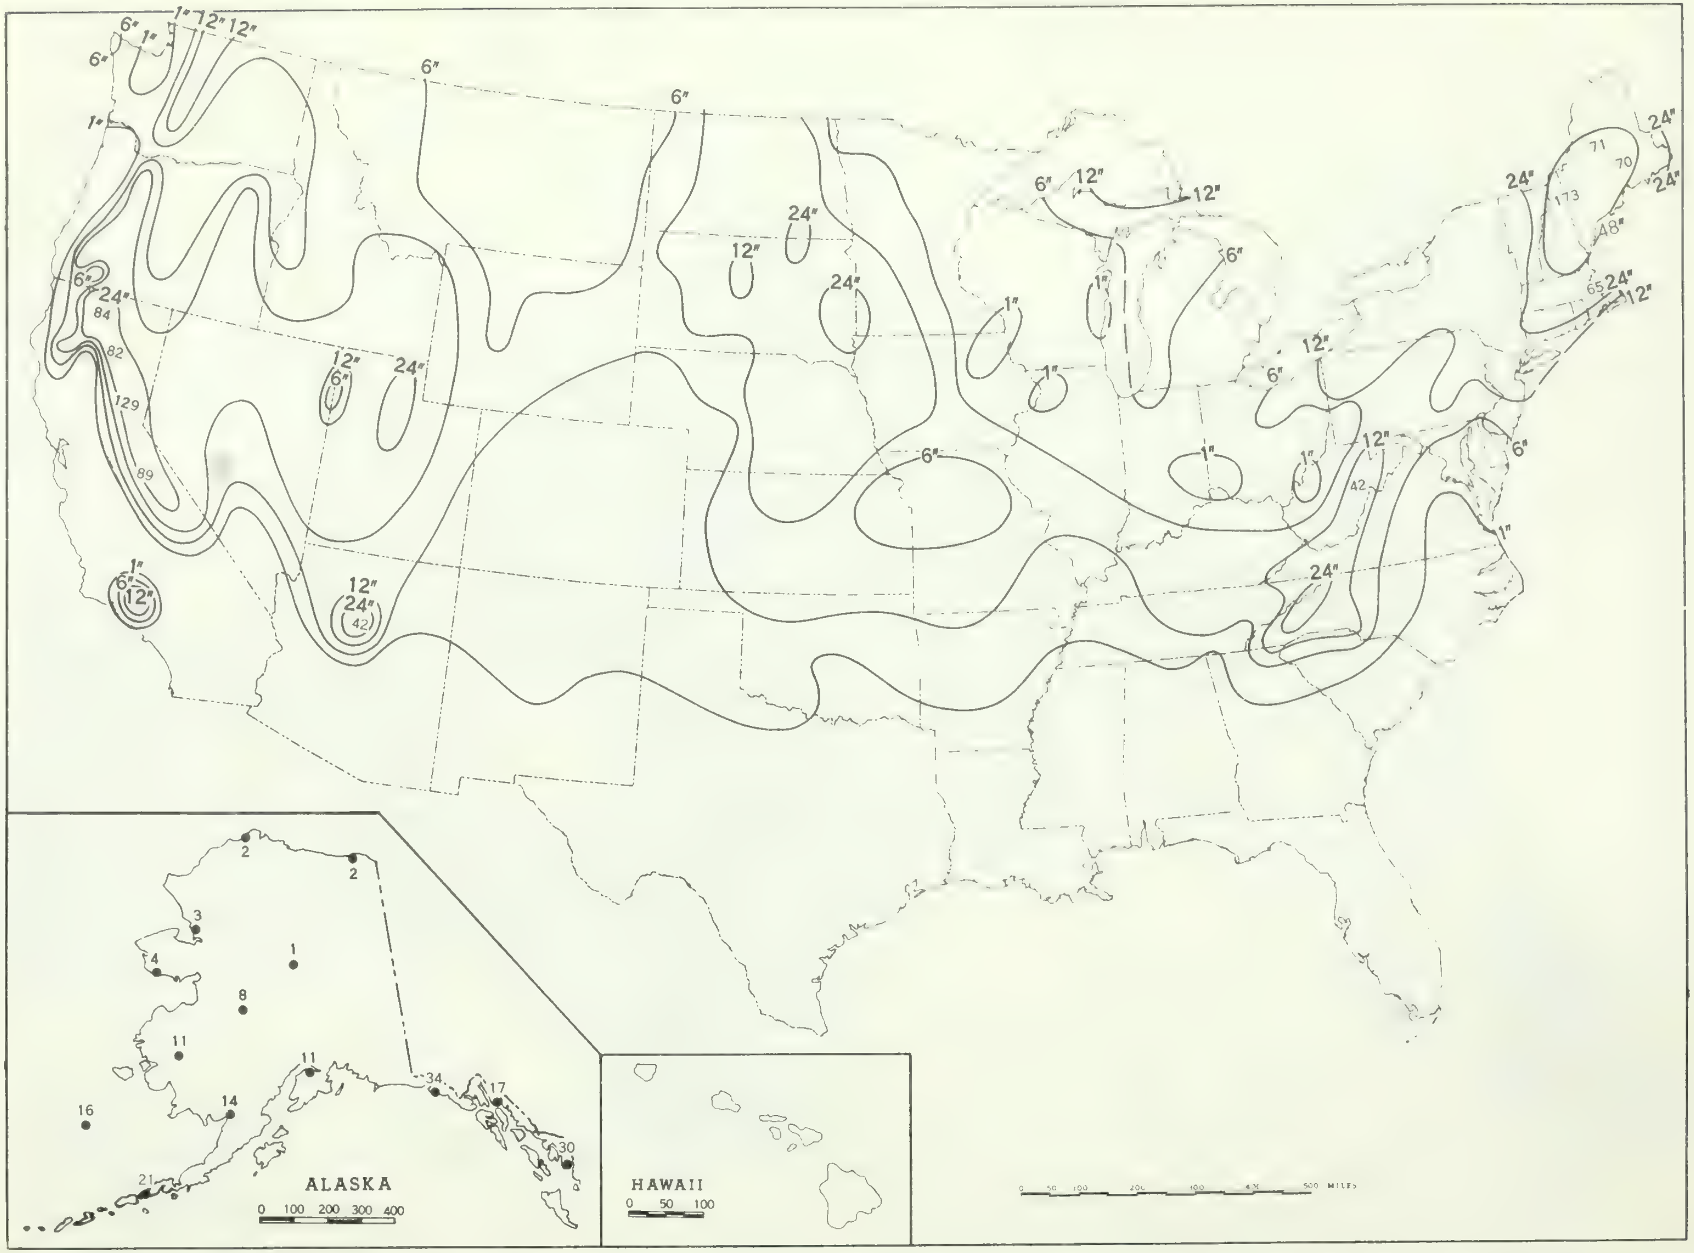
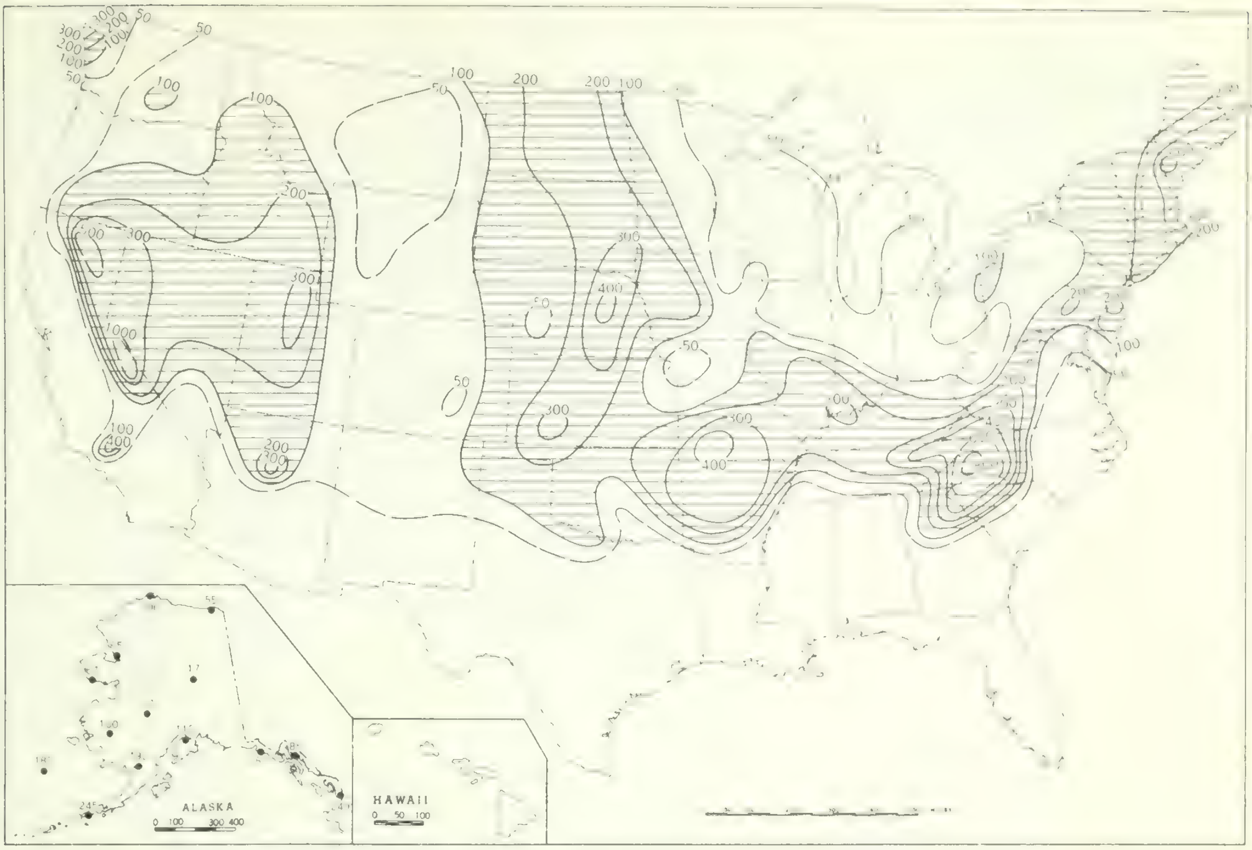
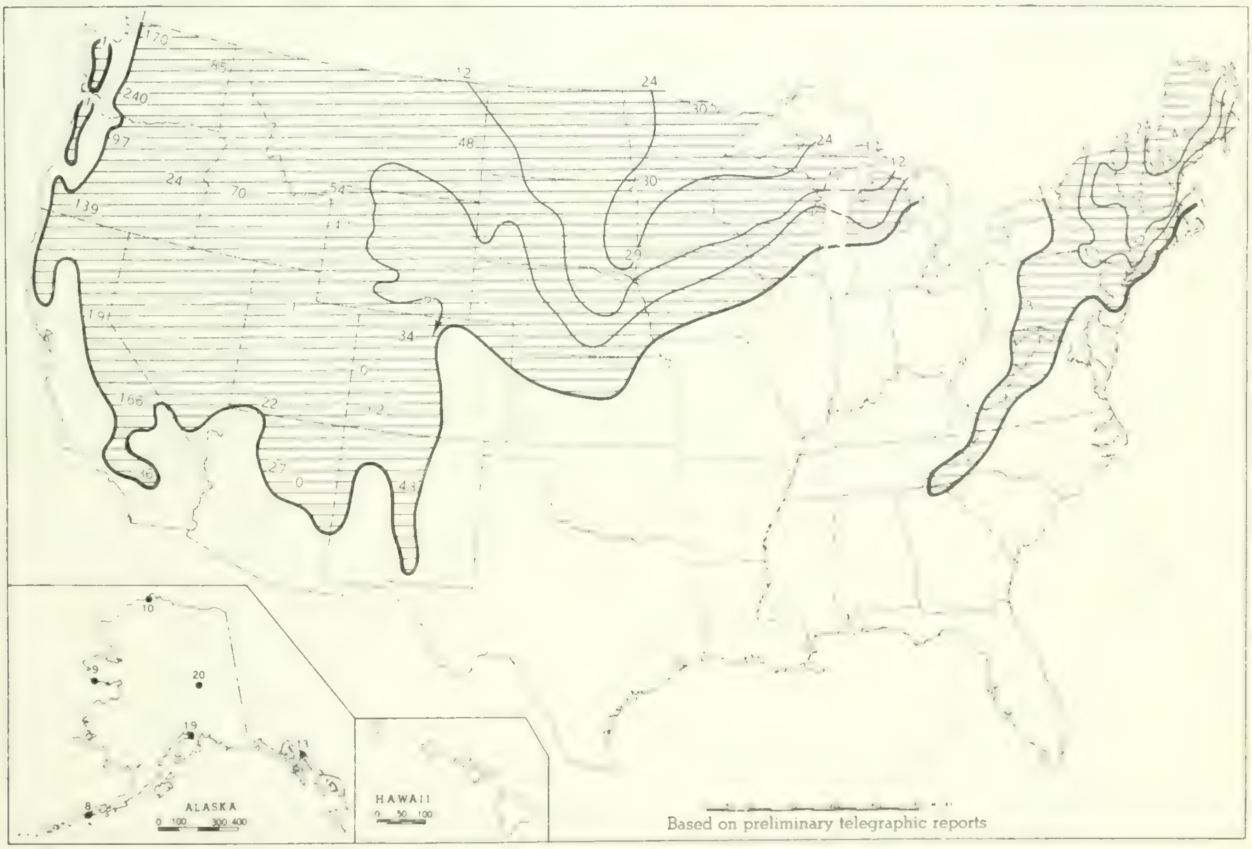


This is the total of unmelted snowfall recorded during the month at Weather Bureau and selected cooperative stations. This Chart and Chart V are published only for the months of November through April, although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, February 1969.

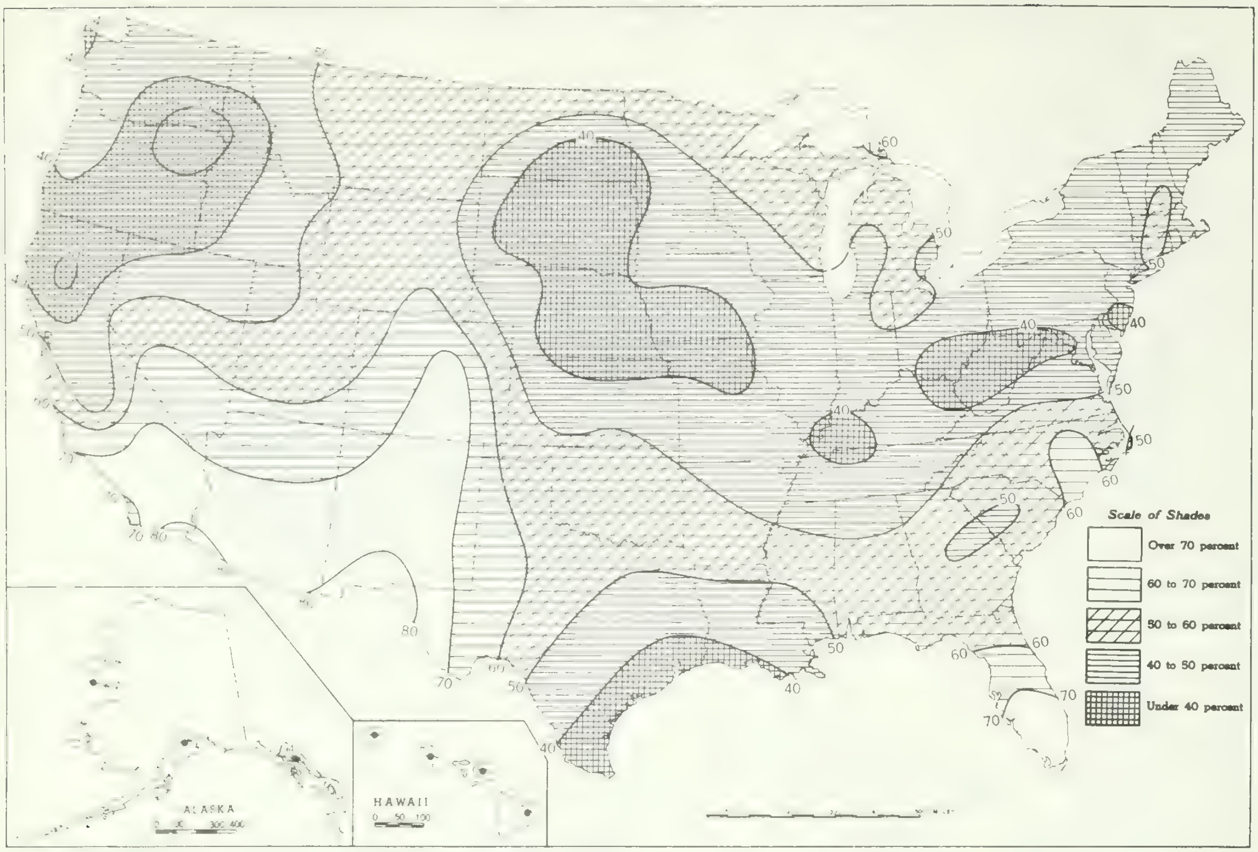


B. Depth of Snow on Ground (Inches), 7:00 a.m. E. S. T., February 24, 1969.



A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a.m. E.S.T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and selected cooperative stations.

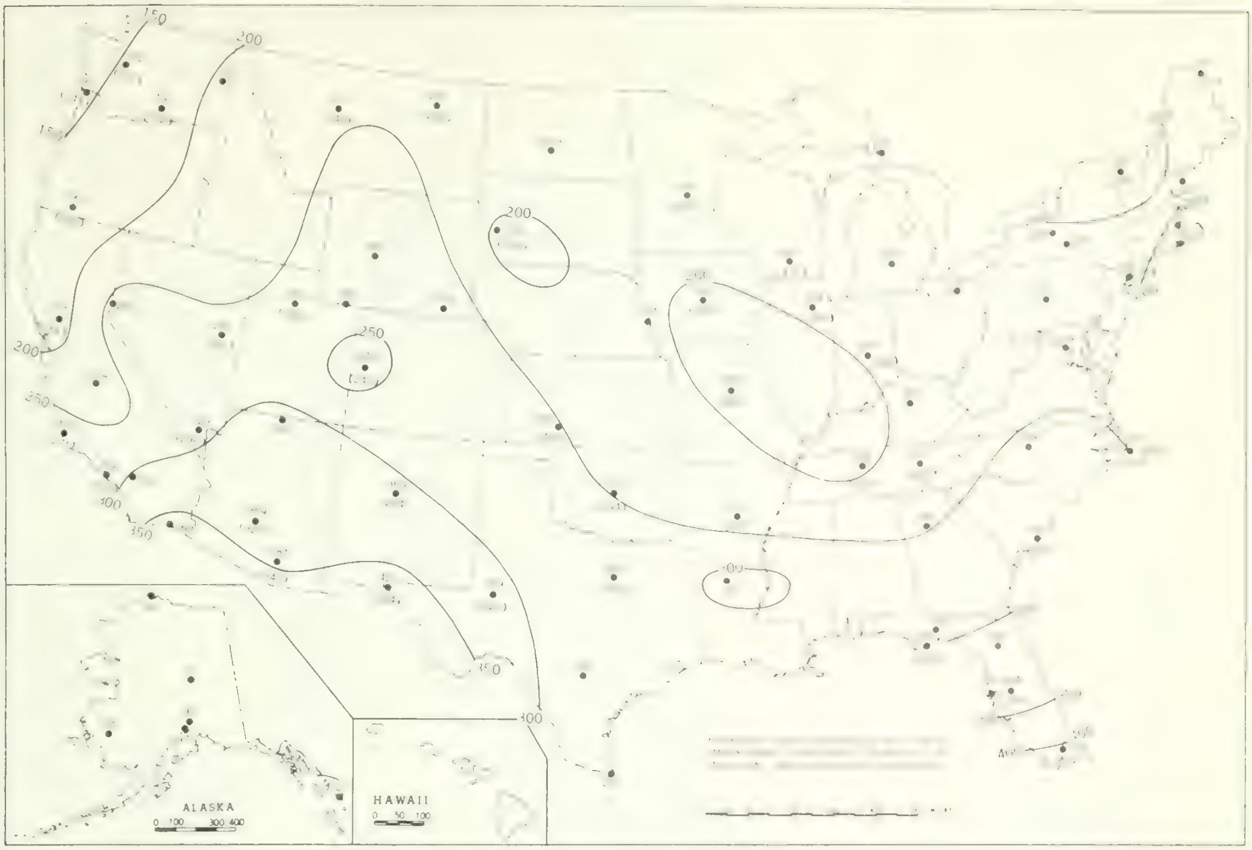
Chart VI. A. Percentage of Possible Sunshine, February 1969.



B. Percentage of Mean Monthly Sunshine, February 1969.

A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

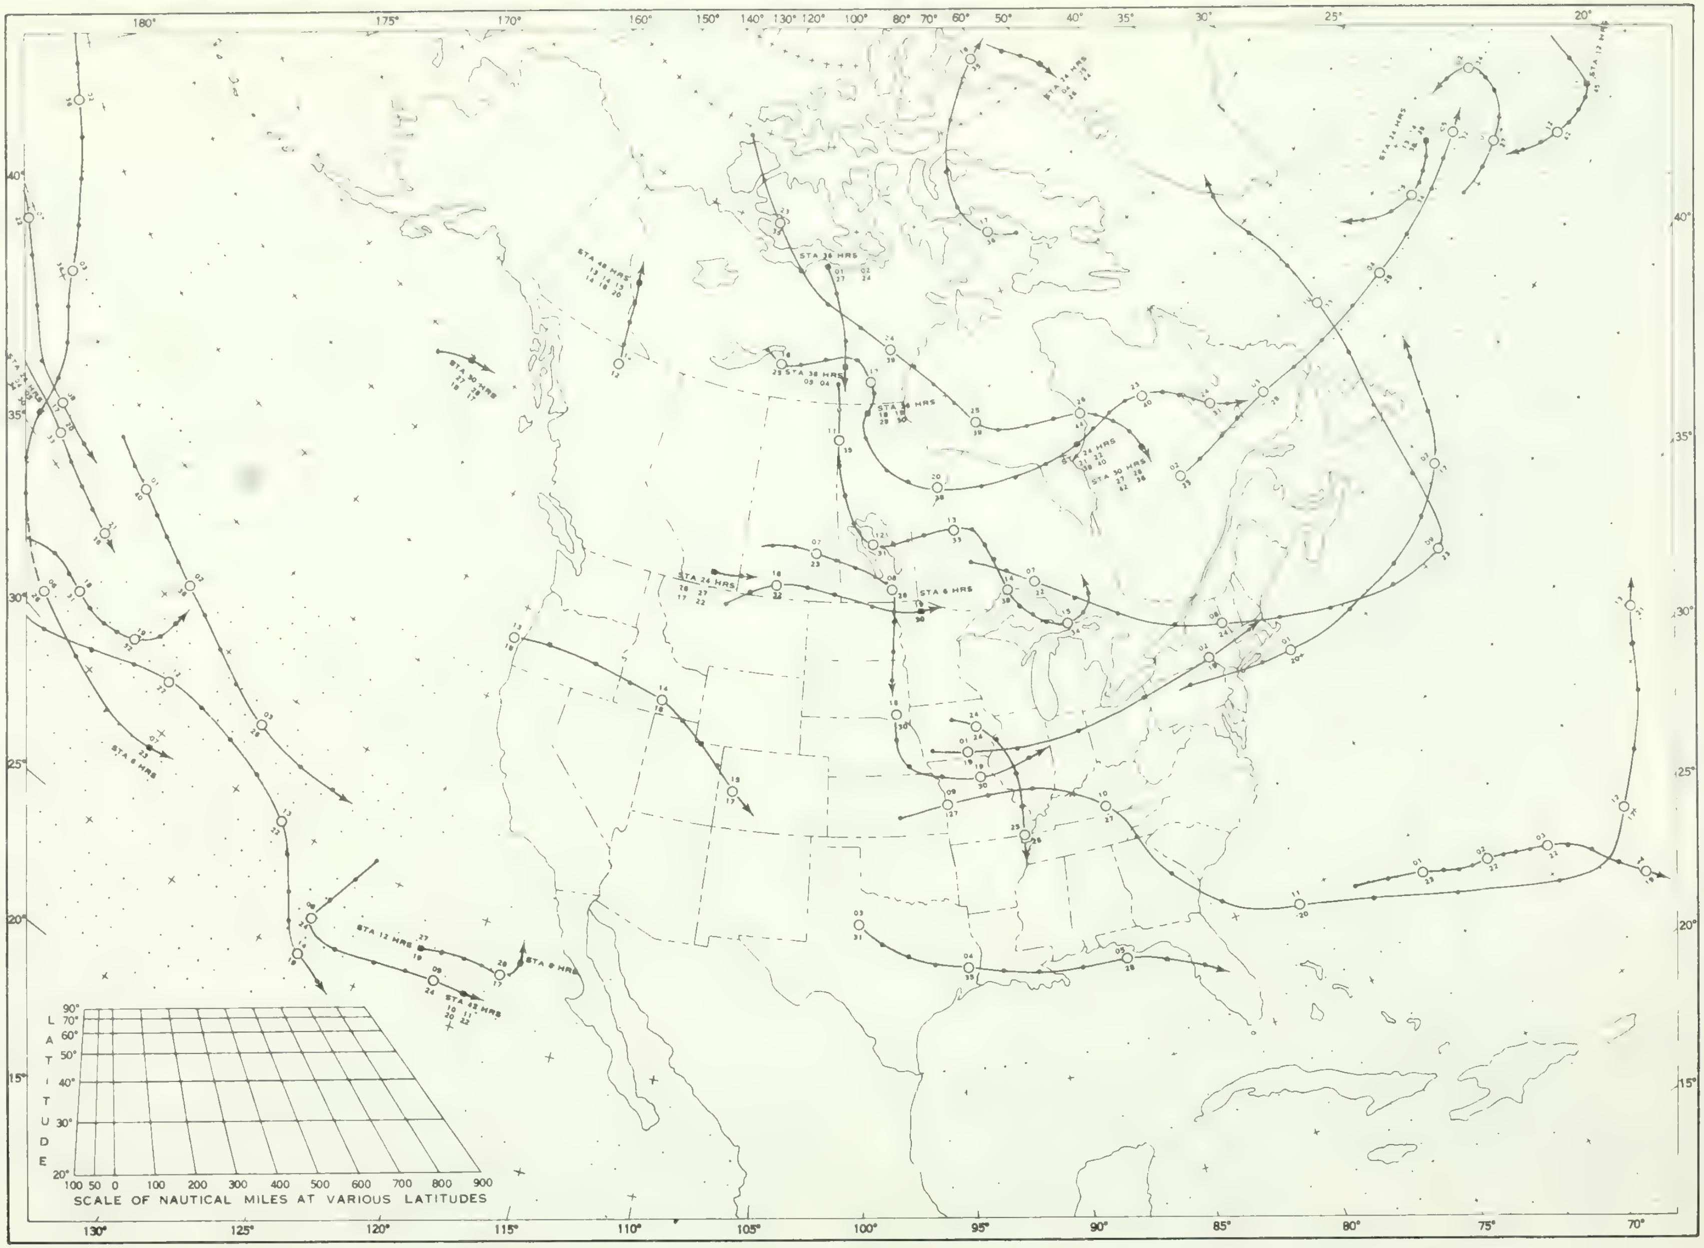
Chart VII. A. Average Daily Values of Solar Radiation, Langleys, February 1969.



B. Percentage of Mean Daily Solar Radiation, February 1969.

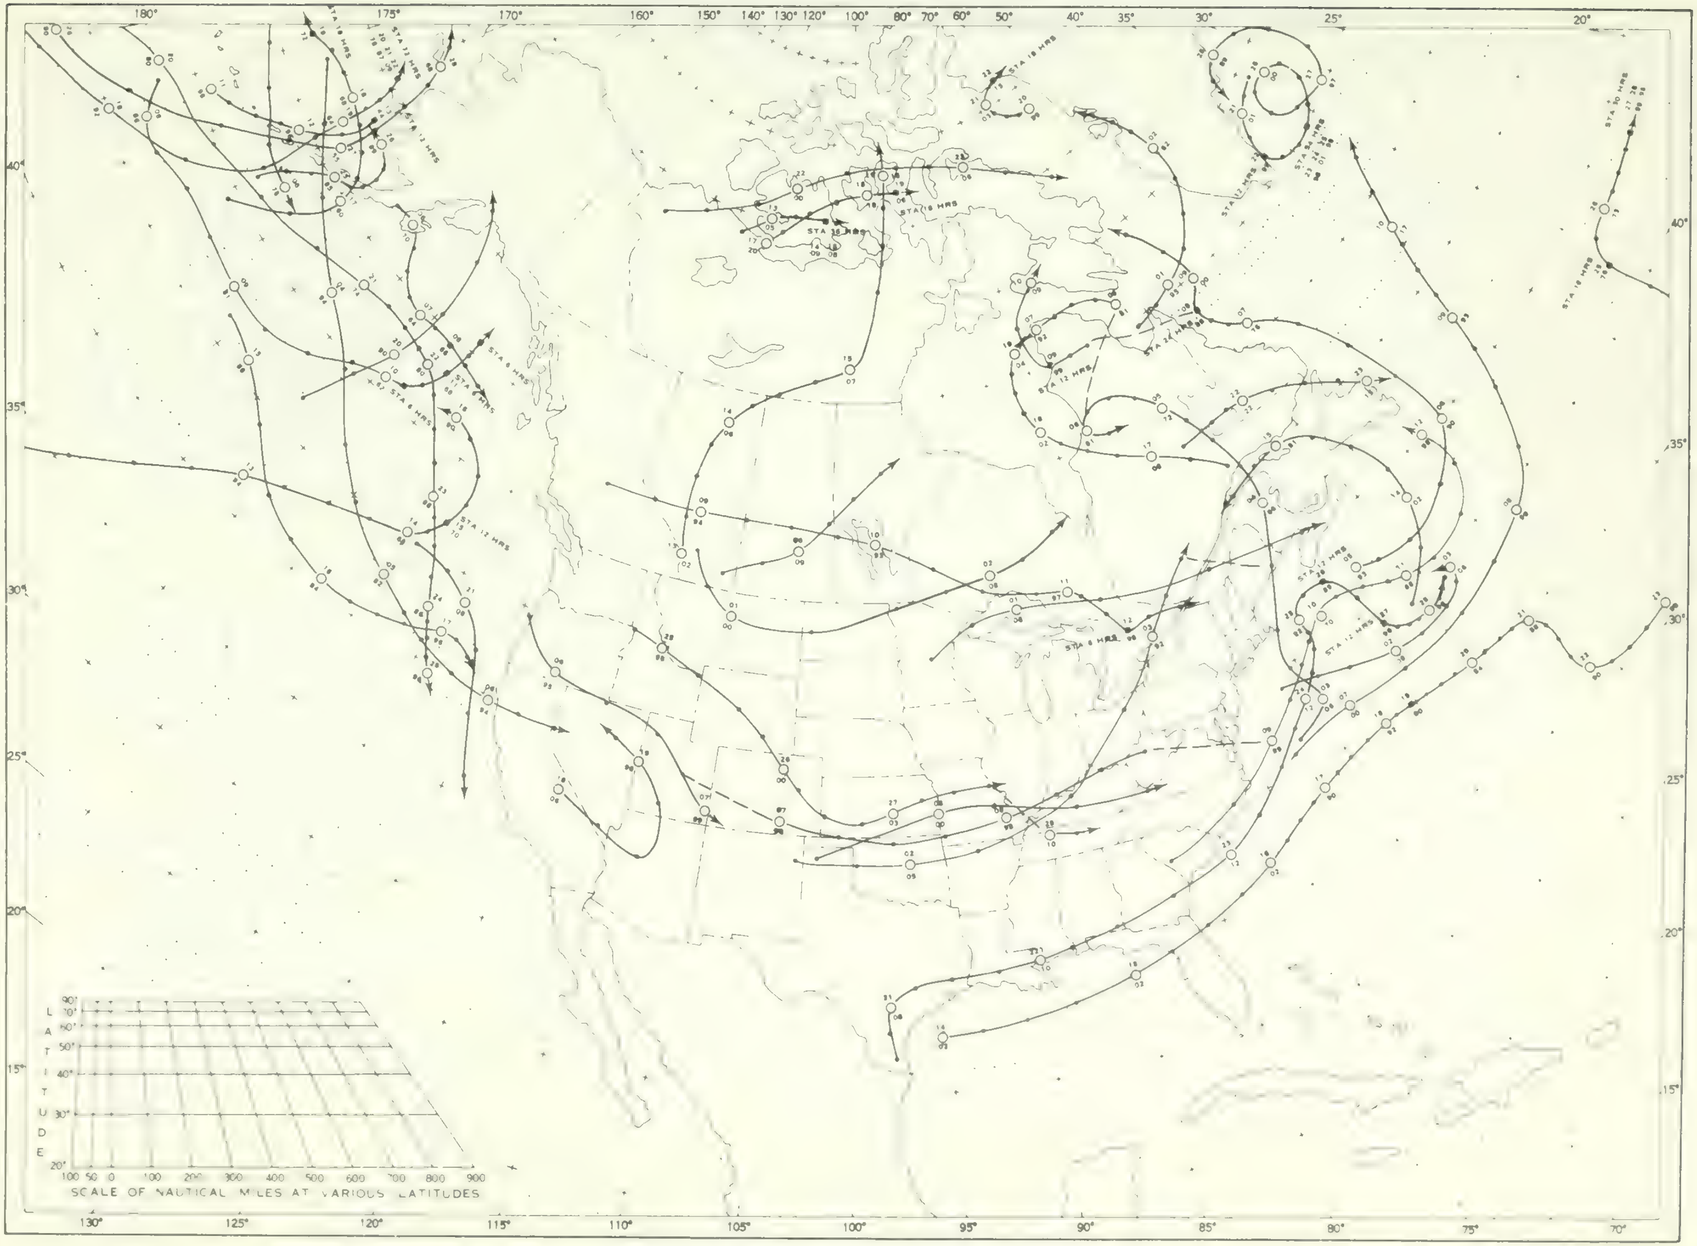
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII Tracks of Centers of Anticyclones at Sea Level, February 1969.



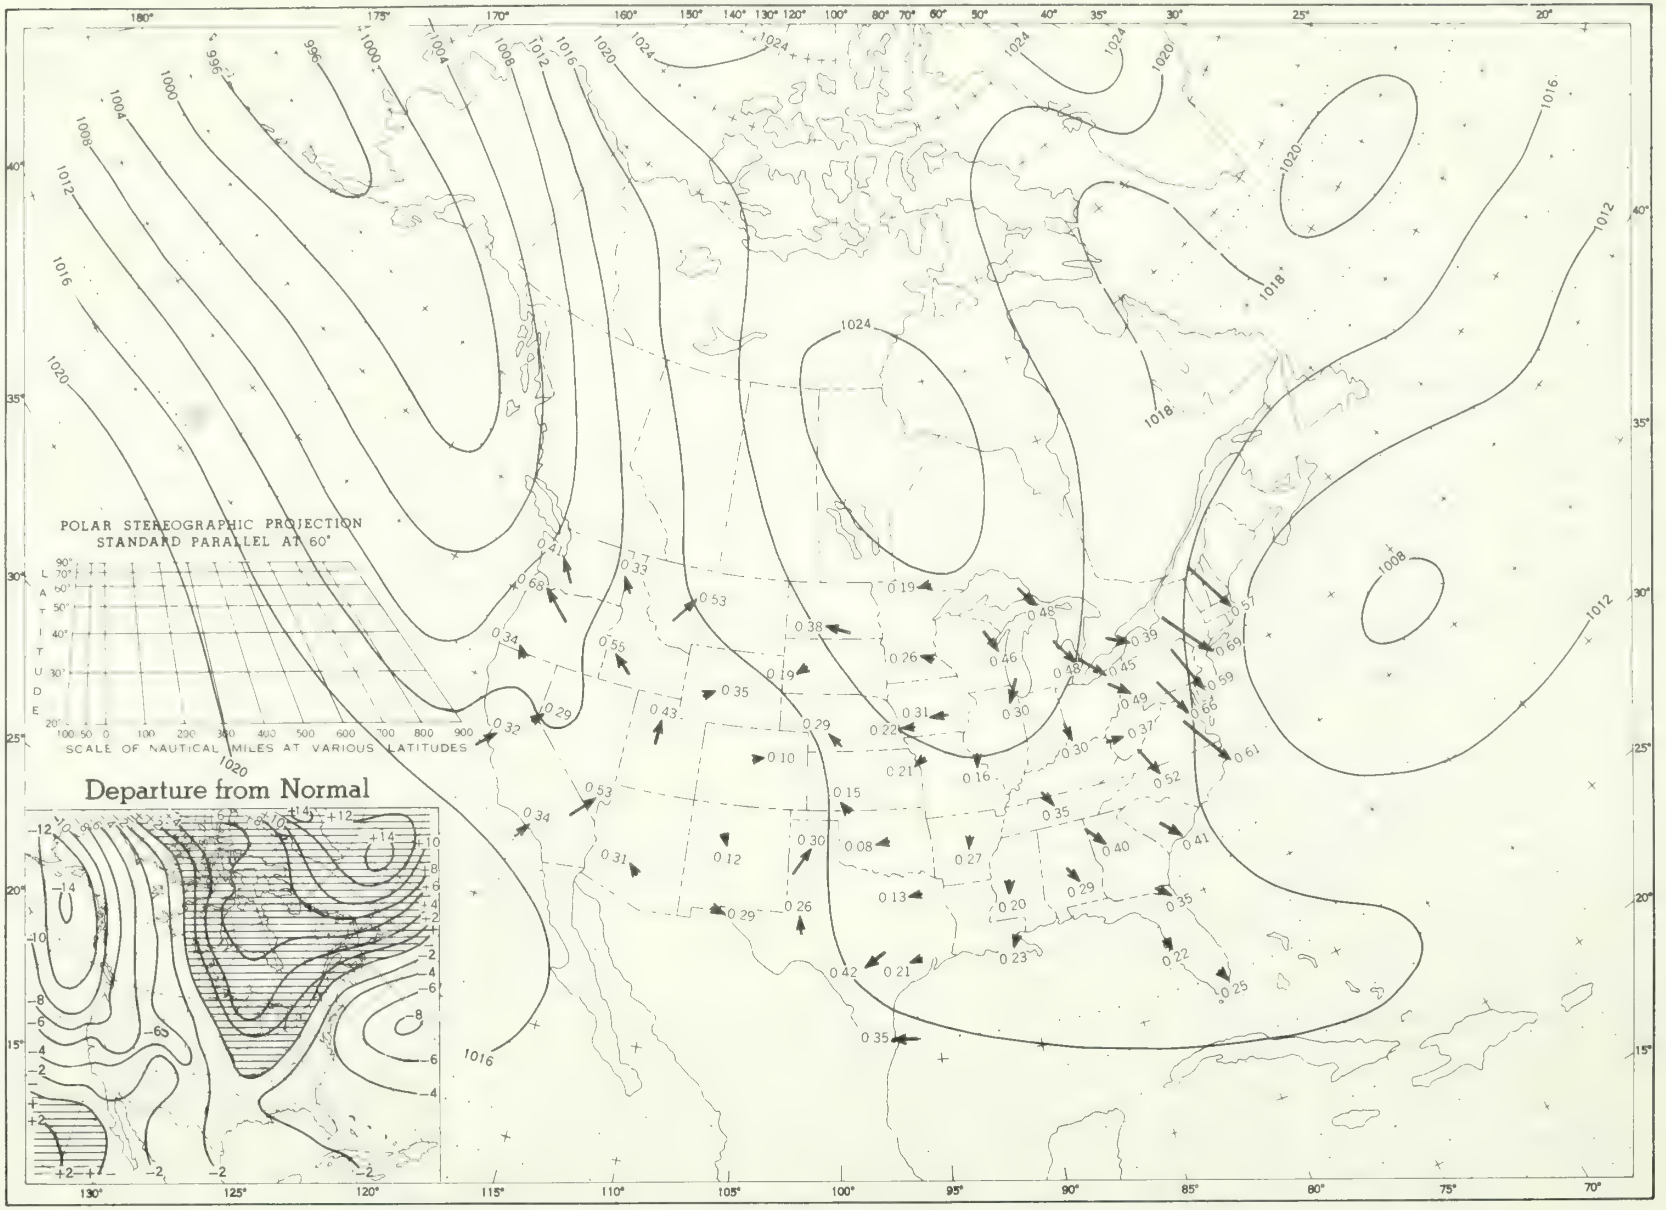
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, **February 1969.**



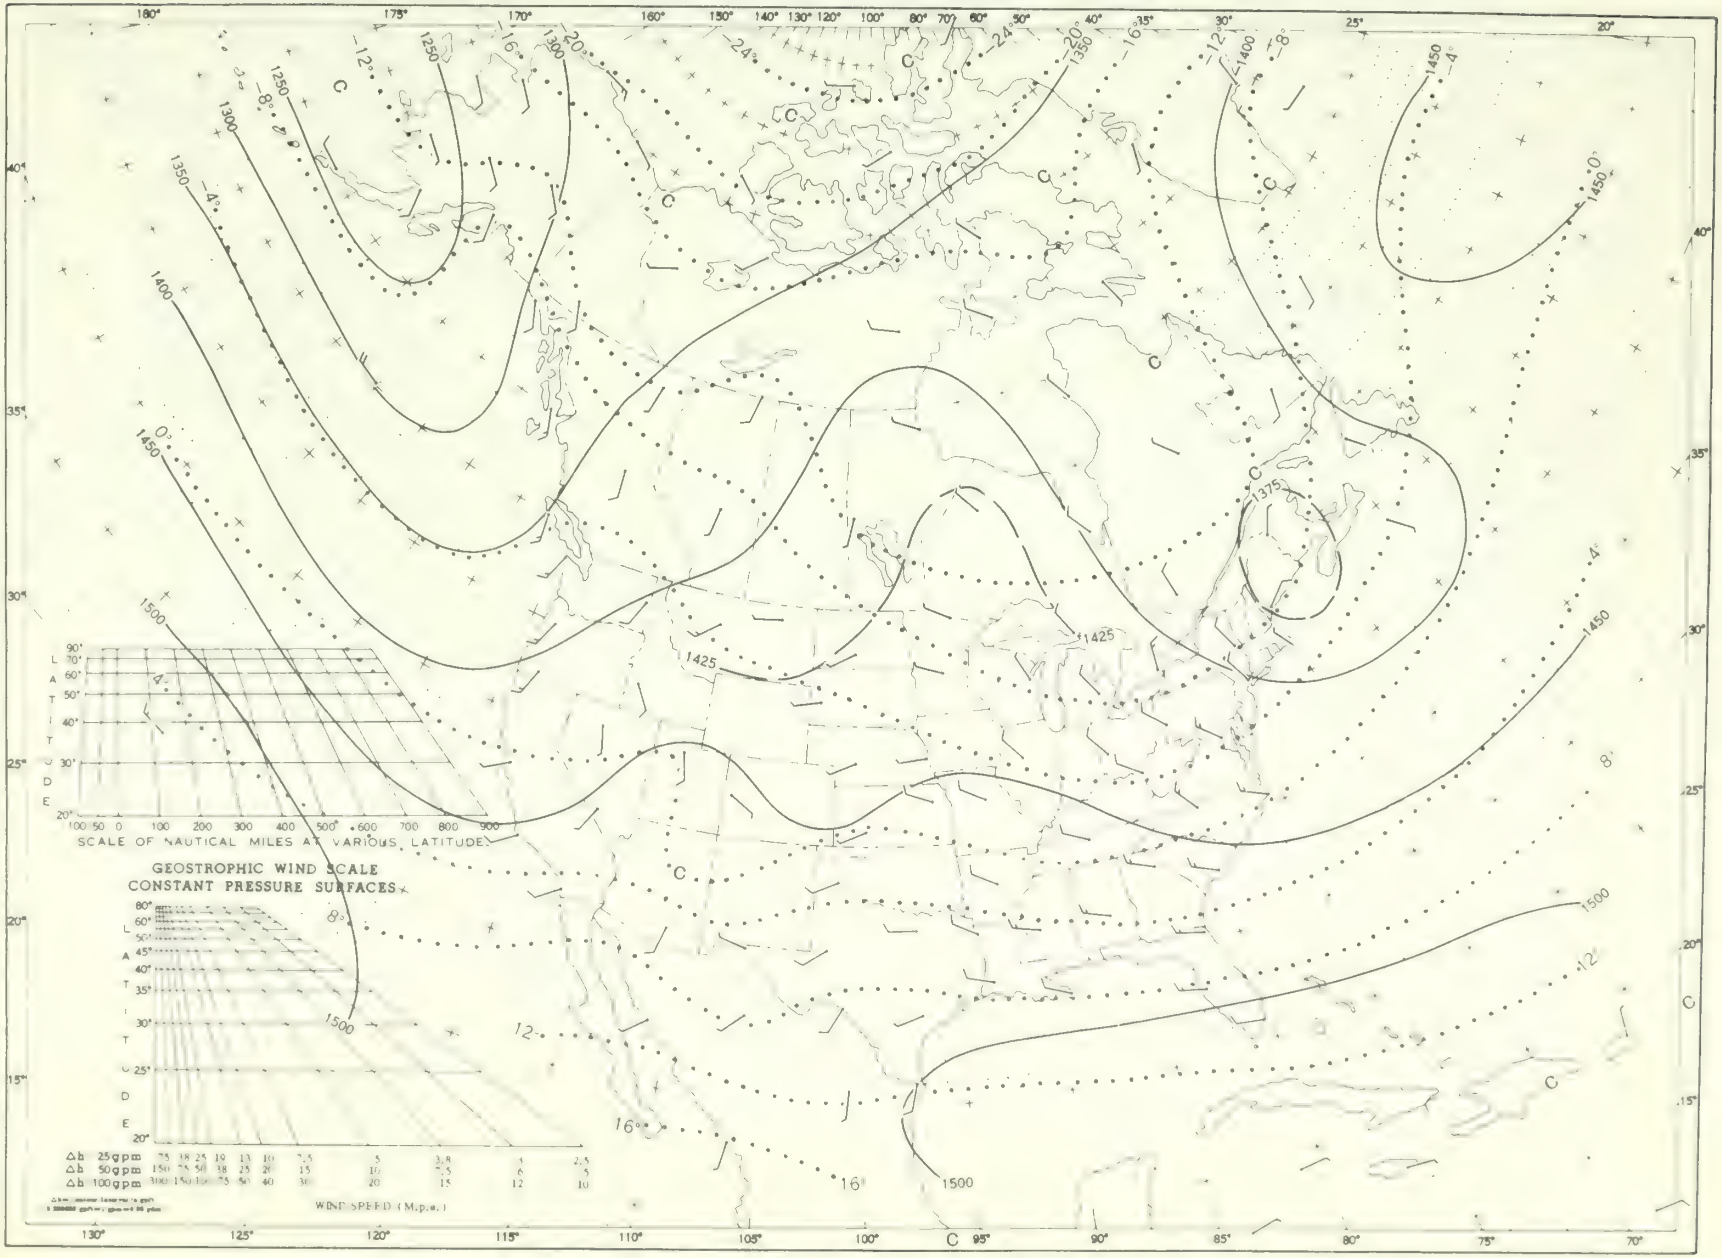
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X   Average Sea Level Pressure (mb) and Resultant Surface Wind, **February 1969**. Inset: Departure of Average Pressure (mb) from Normal, **February 1969**.



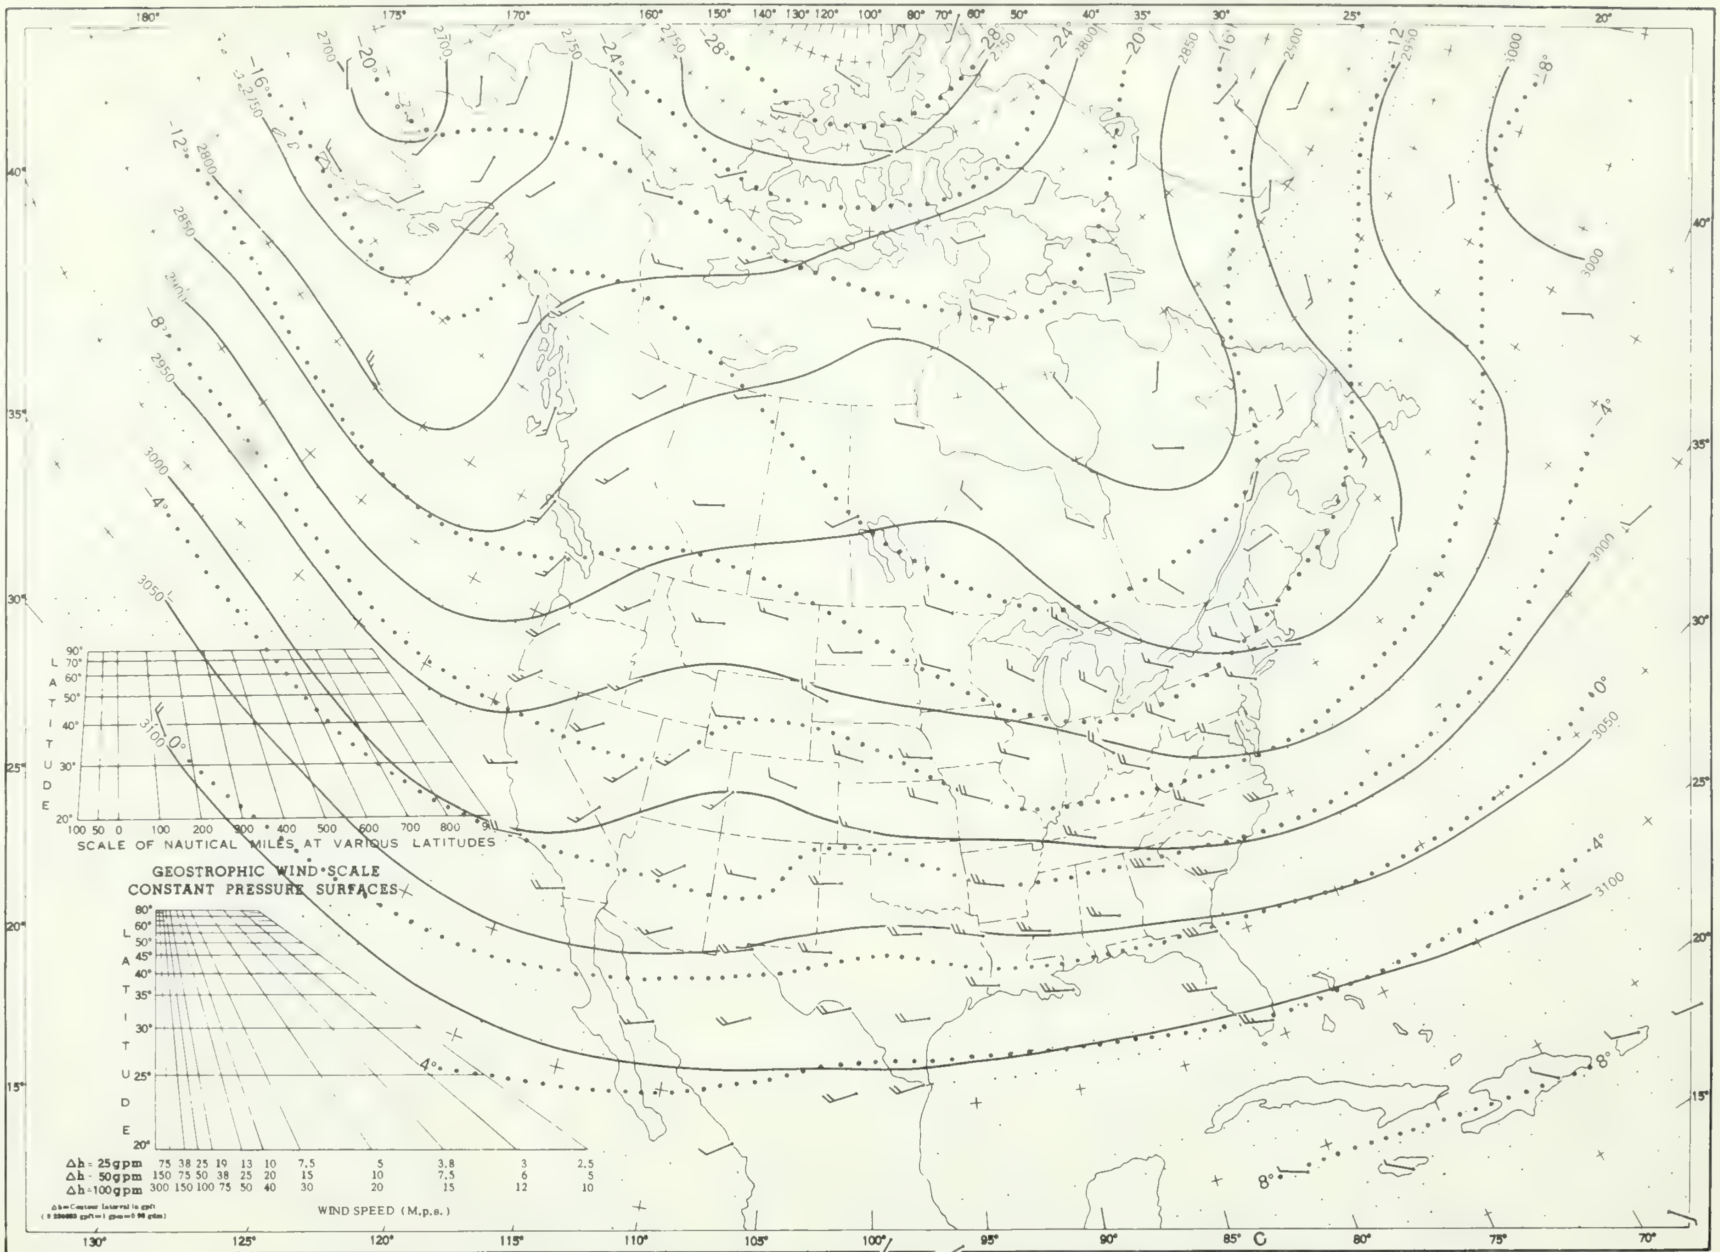
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb. Surface, 1200 GMT, **February 1969**. Average Height and Temperature, and Resultant Winds.



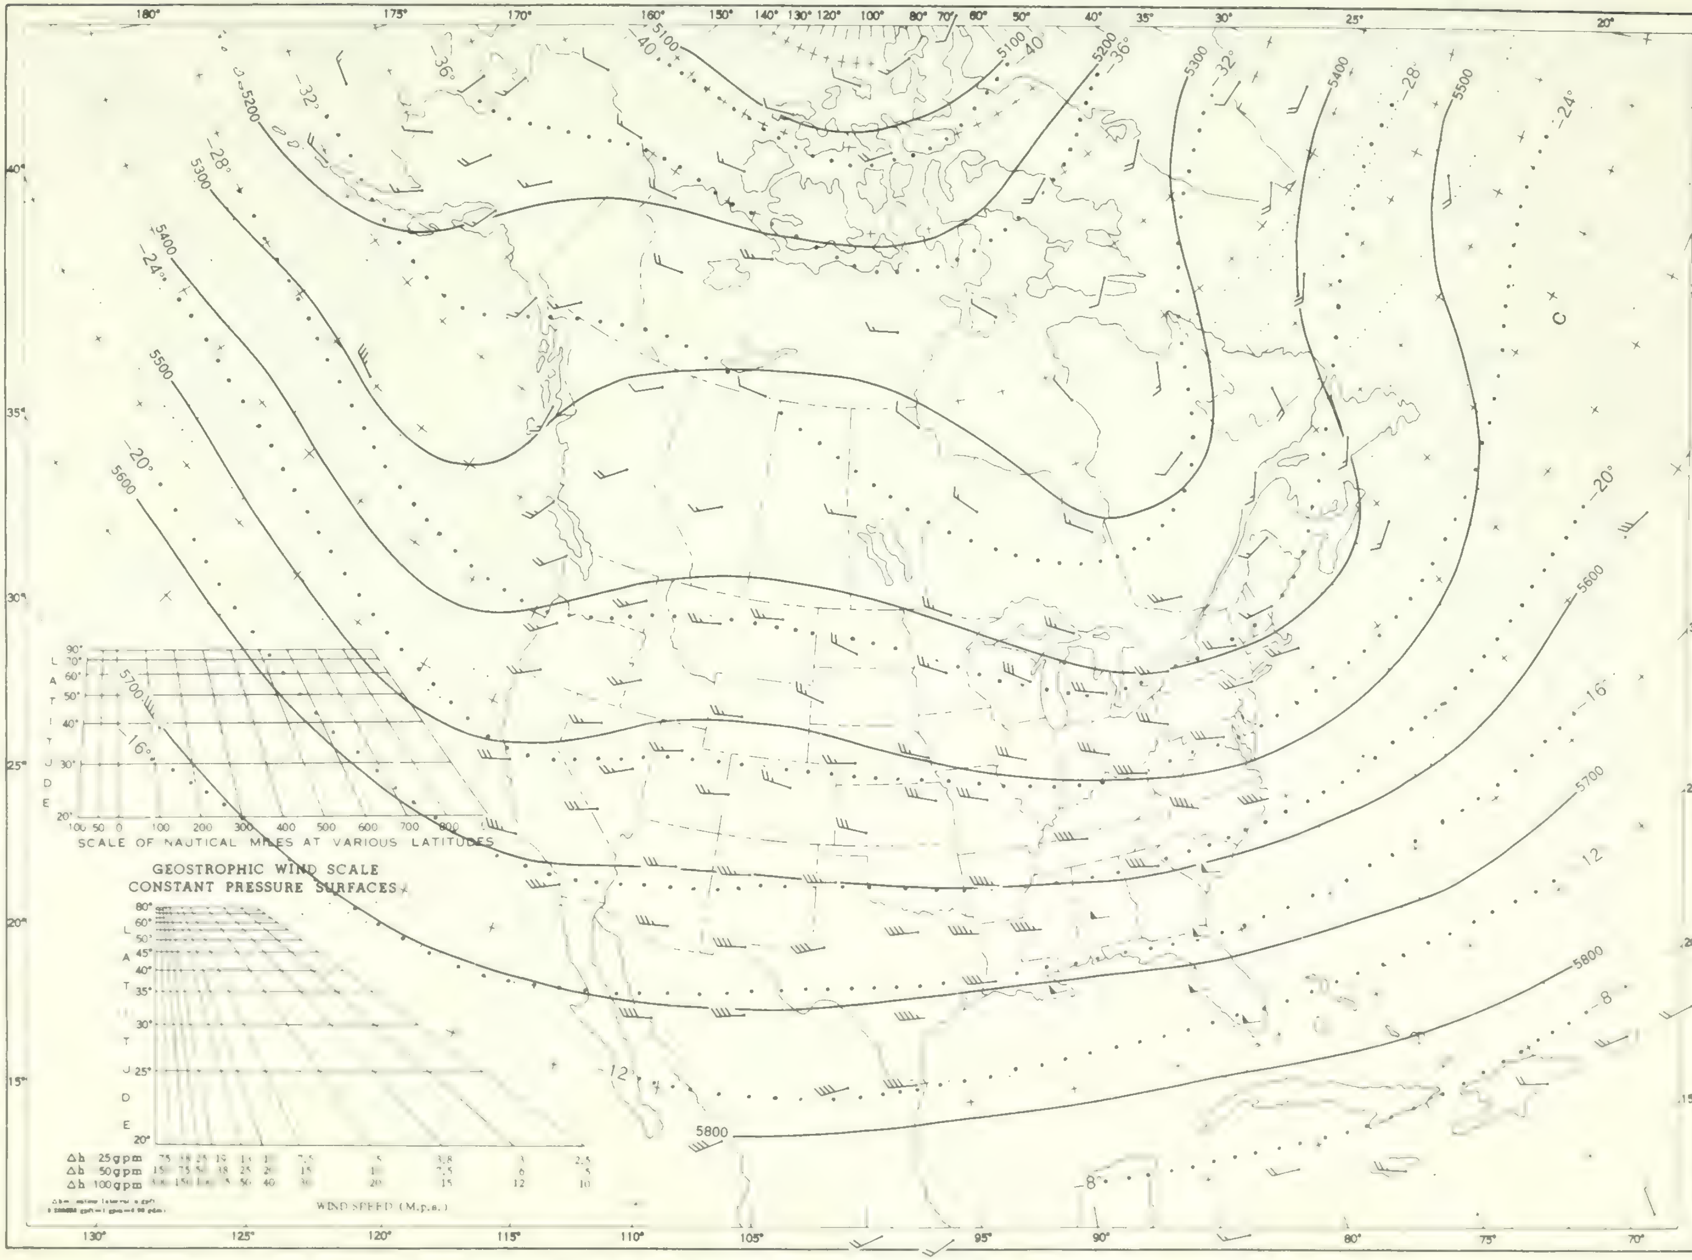
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, **February 1969**. Average Height and Temperature, and Resultant Winds.



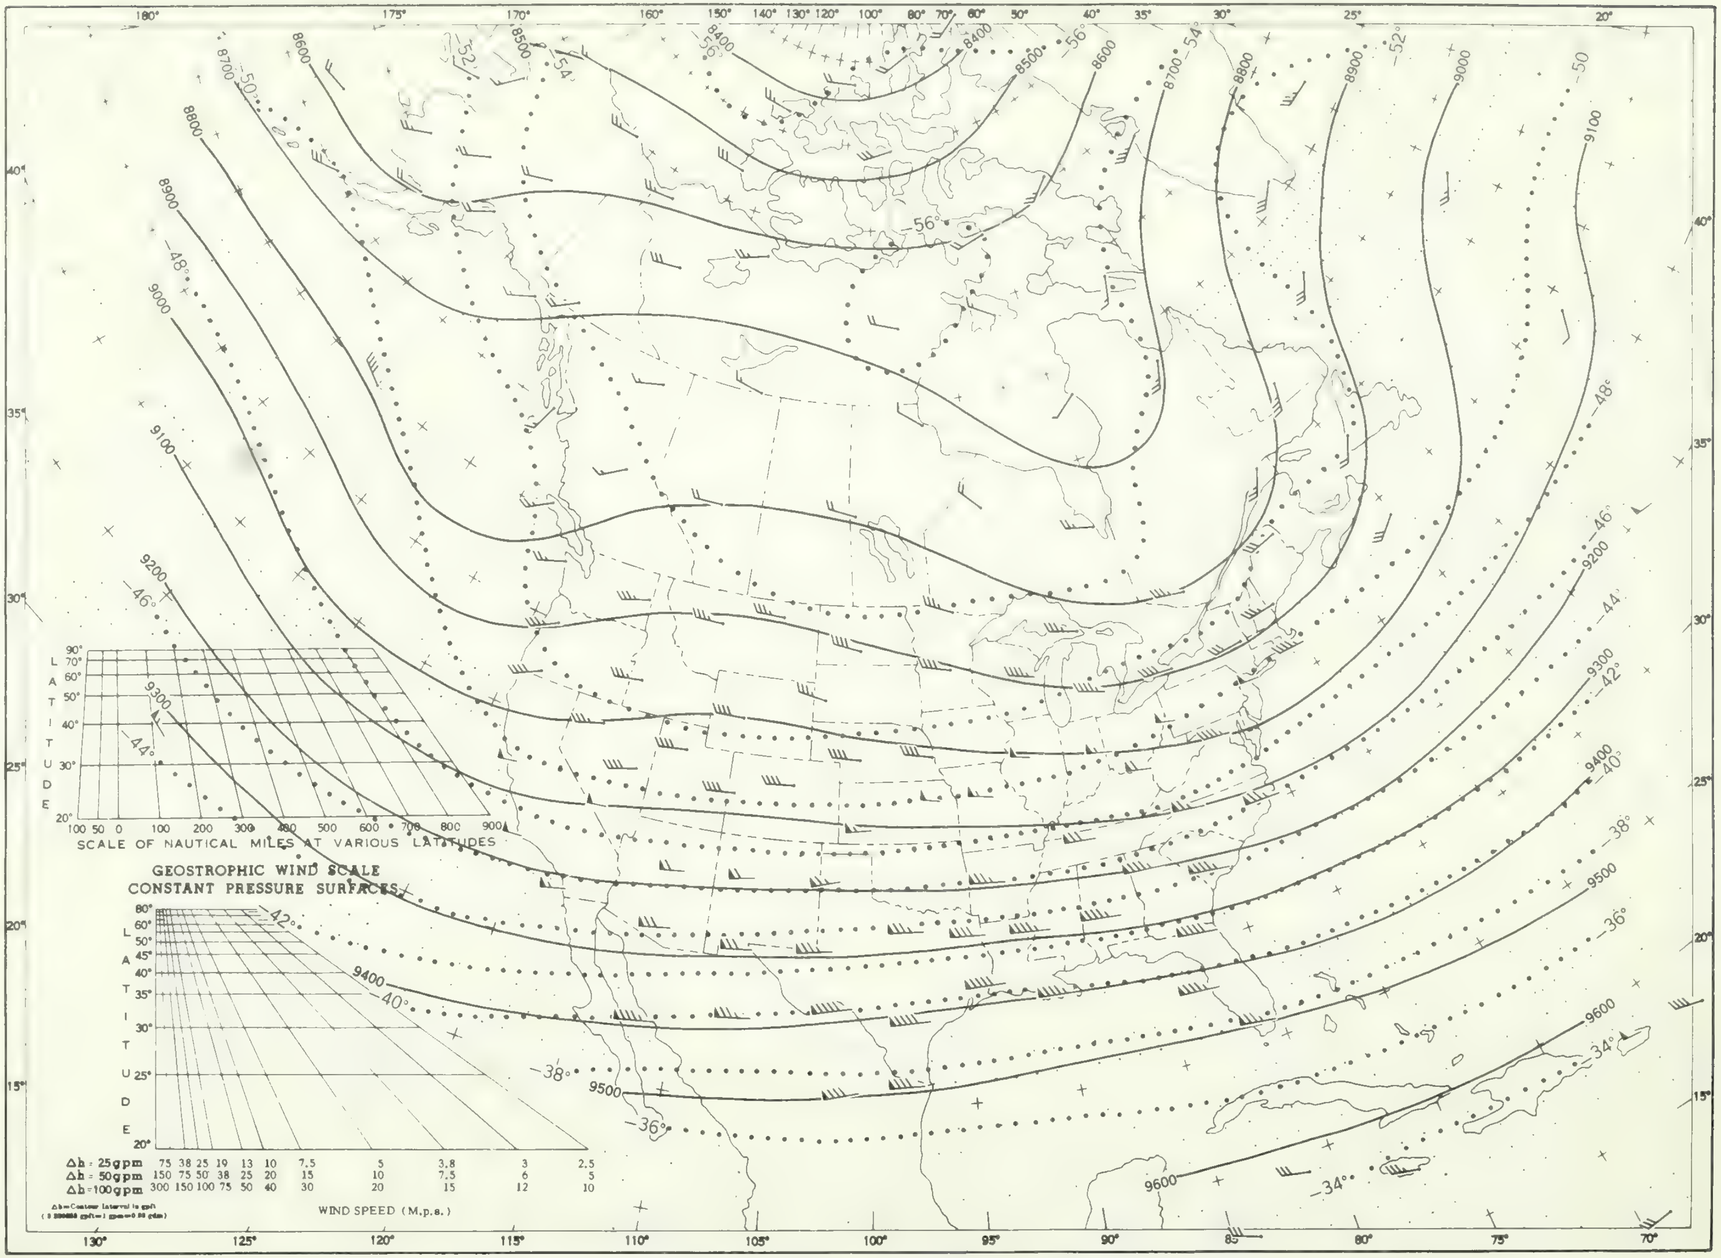
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 GMT, **February 1969**. Average Height and Temperature, and Resultant Winds.



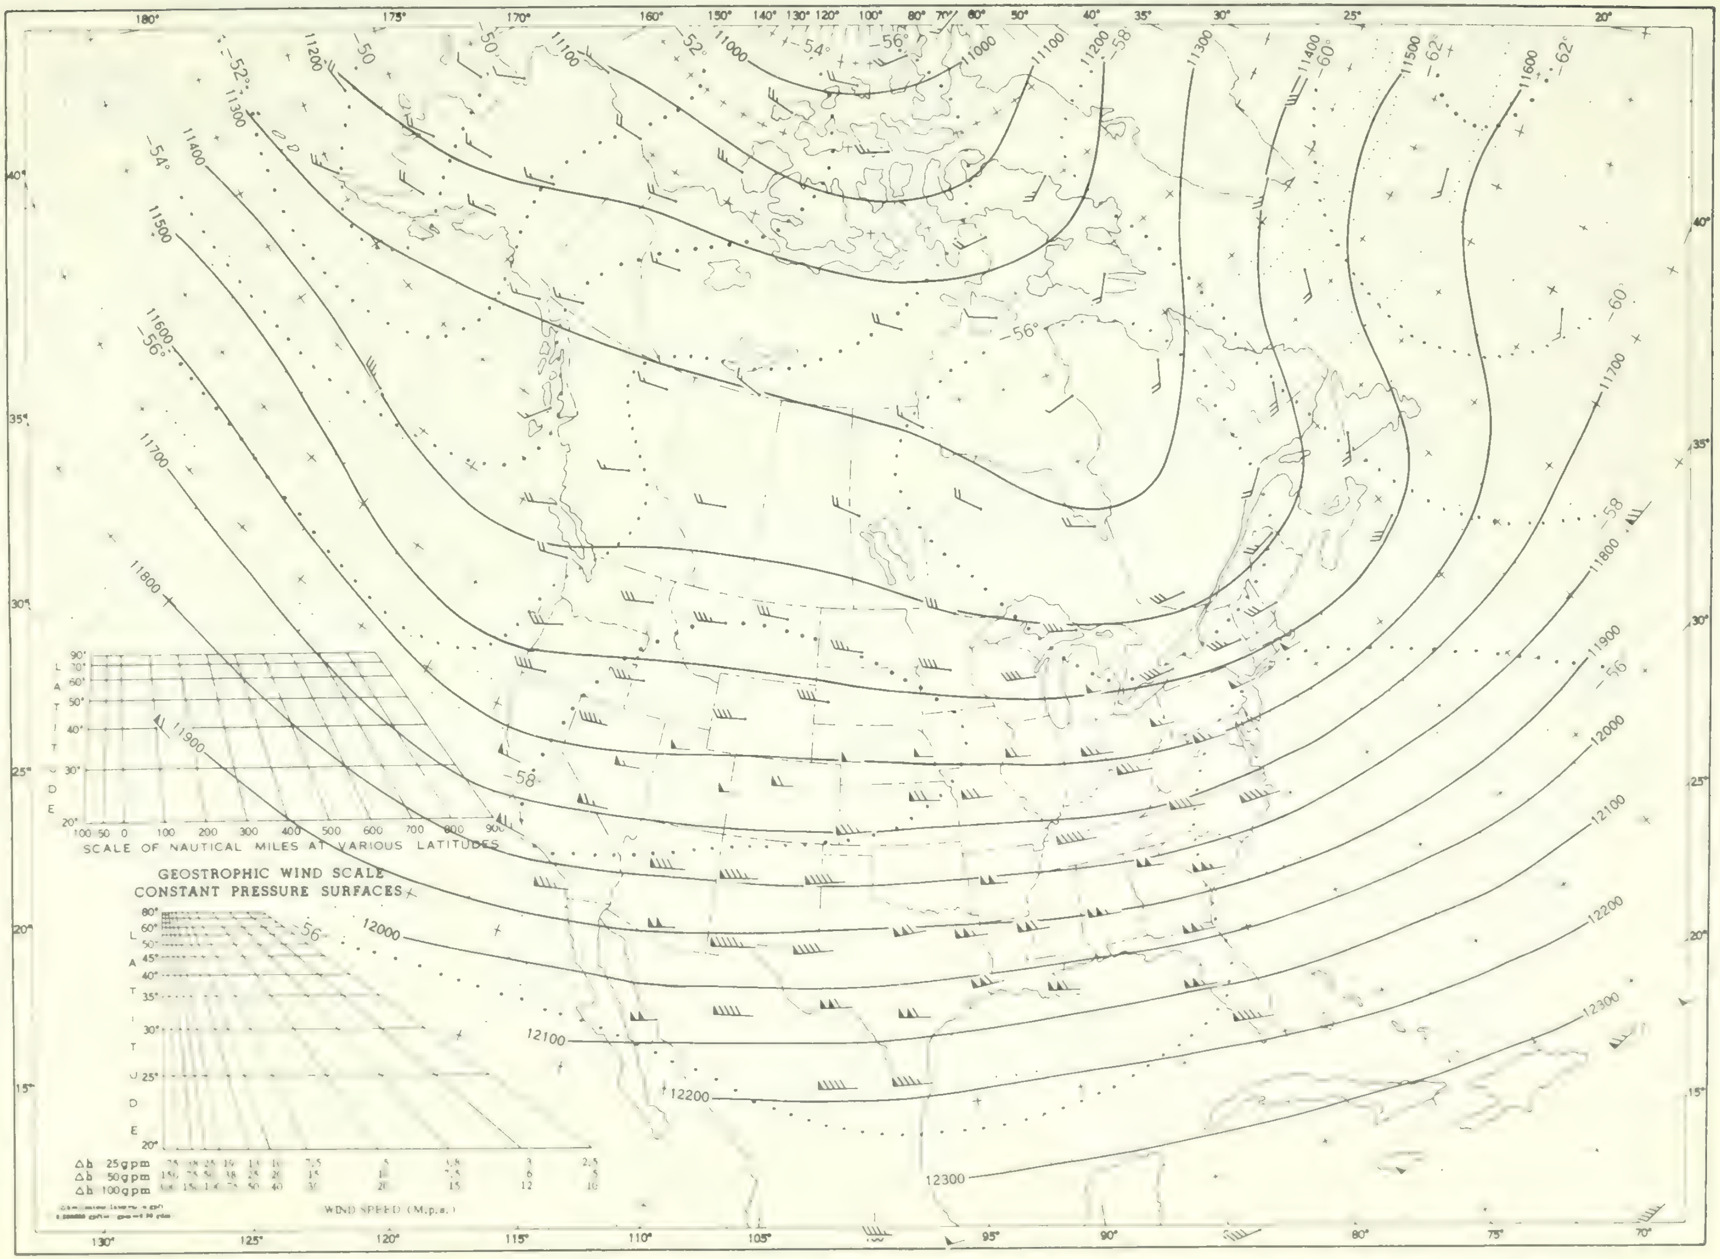
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25mps, full feather 5mps, and half feather 2.5mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 GMT, **February 1969**. Average Height and Temperature, and Resultant Winds.



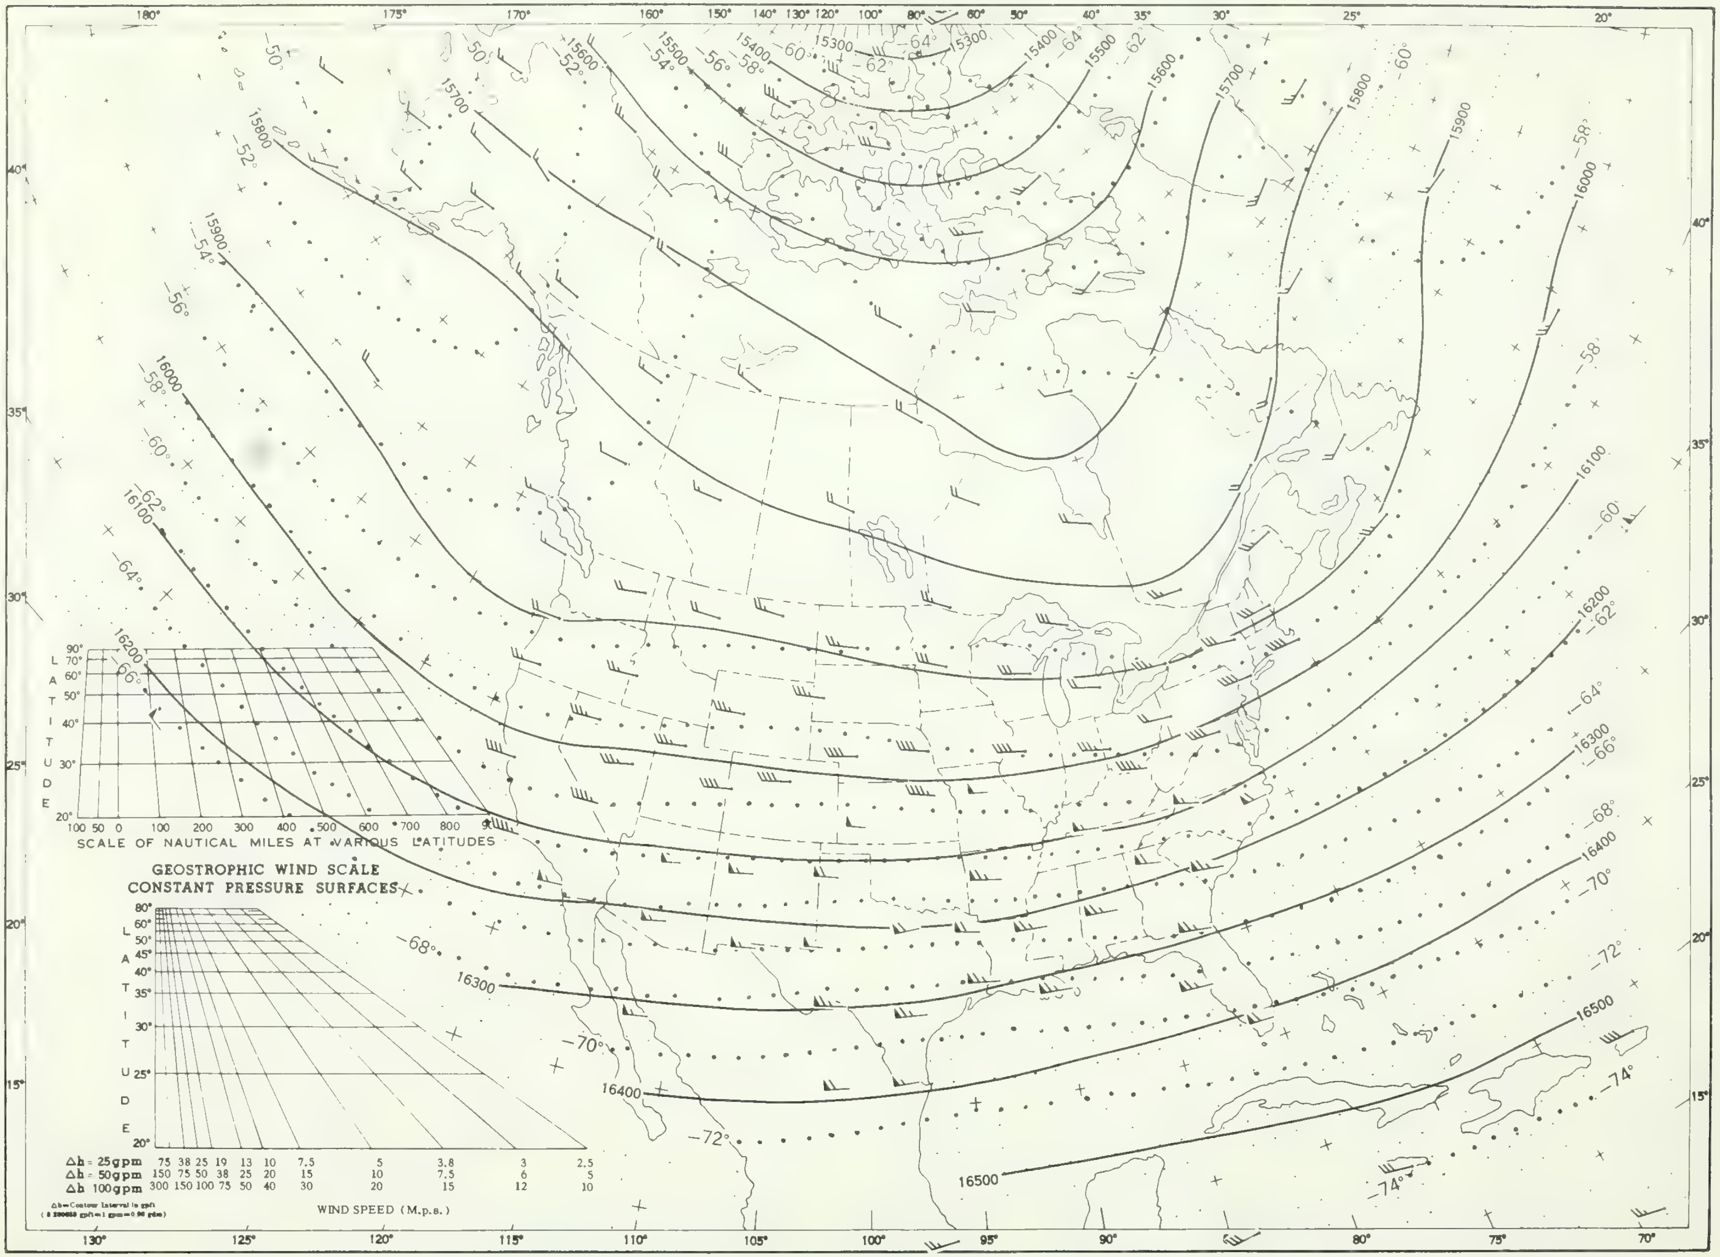
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV. 200-mb. Surface, 1200 GMT, February 1969. Average Height and Temperature, and Resultant Winds



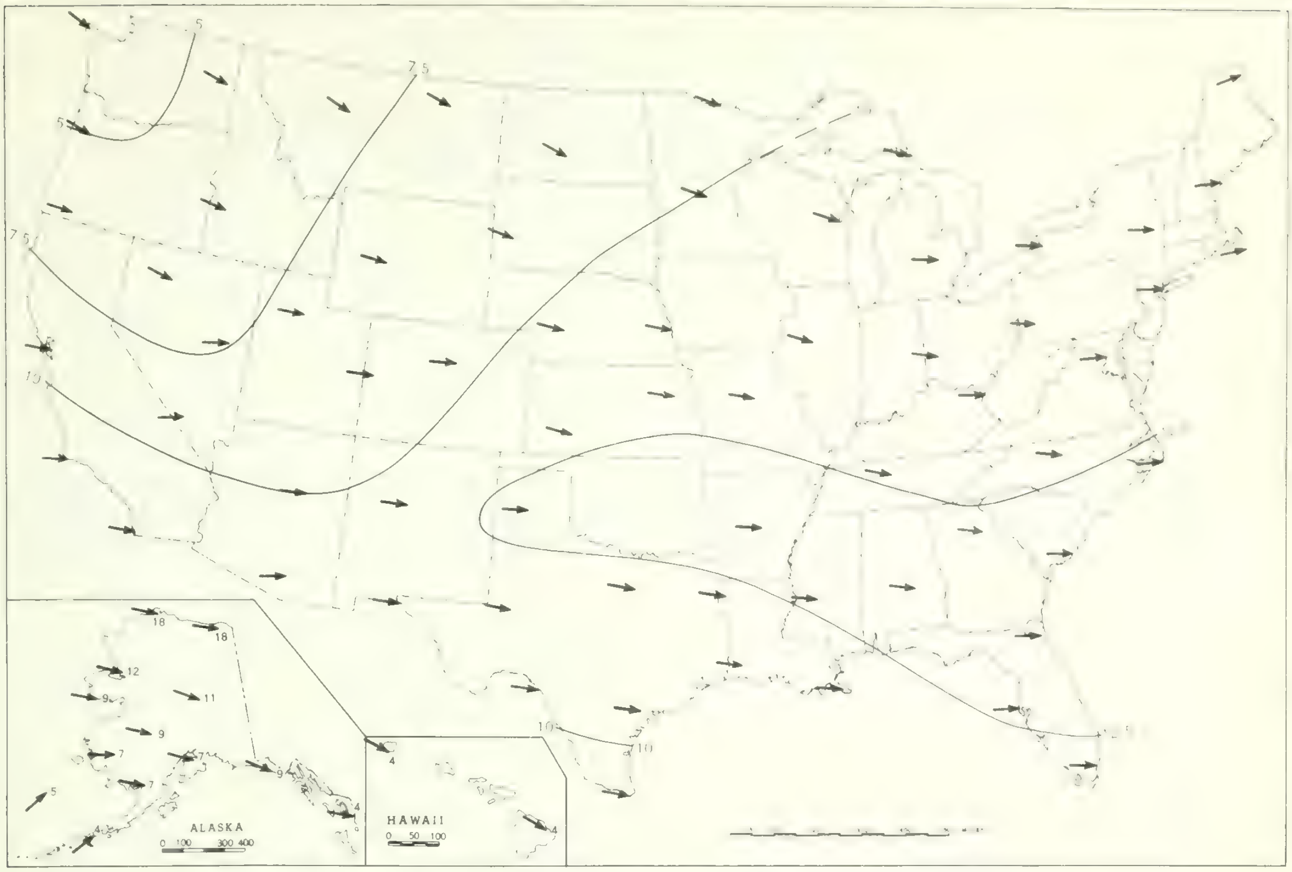
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 GMT, February 1969. Average Height and Temperature, and Resultant Winds

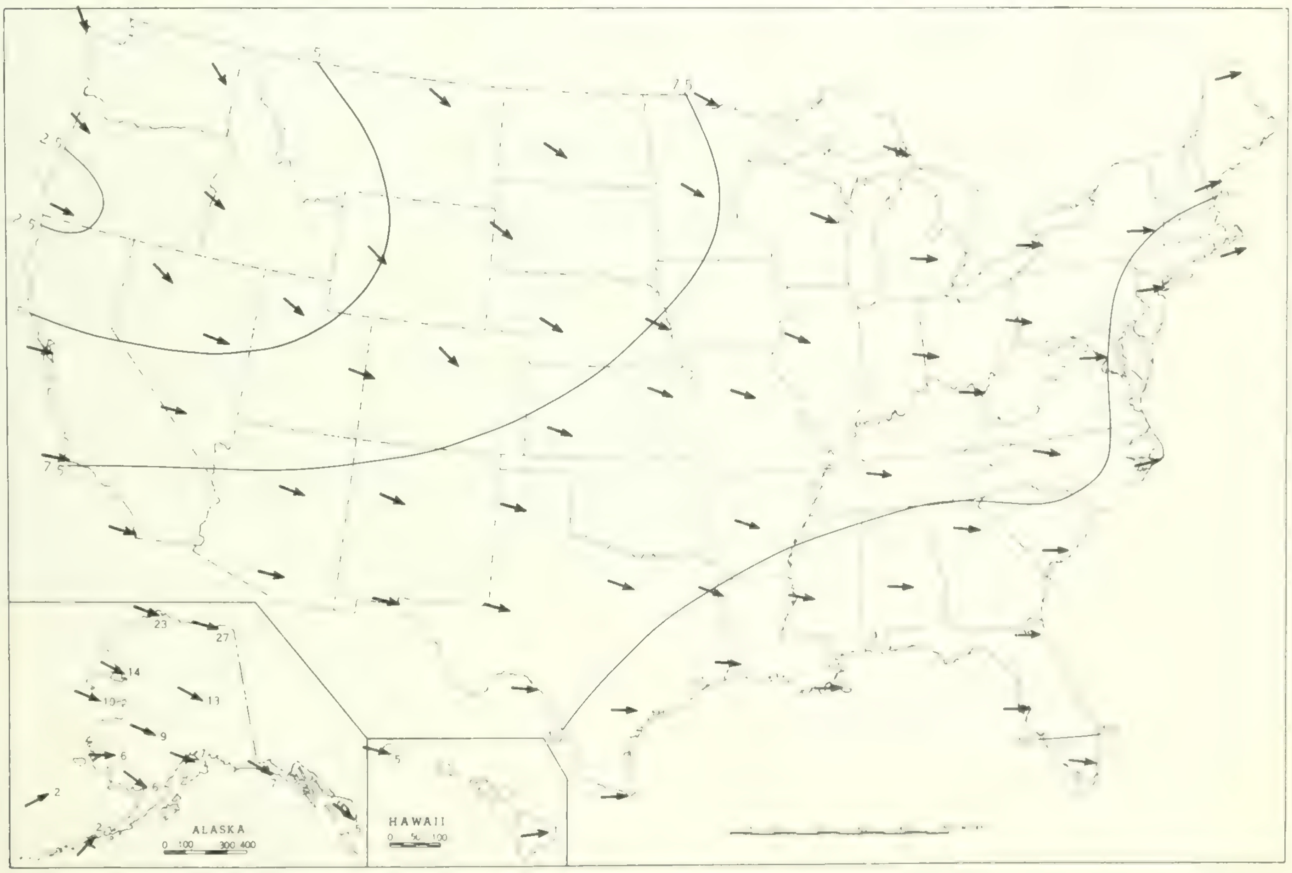


Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 GMT, February 1969. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, February 1969. Resultant Winds.



Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 20 No. 3 MARCH 1969

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. March 1969 averaged colder than any previous March of record at numerous locations.
2. Many stations registered record-breaking low temperatures near the end of March.
3. A few stations received more snow than in any previous March.
4. Many stations received less precipitation in March than in any previous March and at a few stations the 2-month (Feb.-Mar.) and 3-month (Jan.-Mar.) totals were the least of record.

TEMPERATURE.--Only small areas--southern Washington, northern Oregon, and eastern New England--averaged warmer than normal in March. Parts of the Great Basin, most of the Great Plains, and the Southeast averaged 6° to 9° colder than normal. Flagstaff, Ariz., saw the coldest March in 70 years with temperatures averaging 27°. Helena, Mont., endured the coldest winter in 90 years, and at Aberdeen, S. Dak., March 1969 was the only March in the 74-year record that the temperature did not reach 40°. Also, southern locations registered exceptionally low average March temperatures: Roswell, N. Mex., 43.1°, the coldest in 54 years; Jackson, Miss., 49.3°, the 3d coldest March in this century; Tallahassee, Fla., 53.4°, the coldest March in the 83-year record; and numerous others.

In general, cold weather prevailed over the West until a warming trend began shortly after midmonth. March began mild in the Central States and Northeast before a cooling trend dropped temperatures sharply. Subzero temperatures occurred in more than a dozen north-central States about mid-March. Some late-season, subzero records set include: -15° at Fargo, N. Dak., on the 29th; -7° at Rochester, Minn., same date; and -5° at Sioux Falls, S. Dak., on the 30th.

The unusually heavy accumulation of snow throughout the Upper Midwest created a threat of severe flooding during the snowmelt period. Water equivalent values ranged from 3 to 4 inches to as much as 8 to 10 inches in north-central and southwestern Minnesota. At the end of March, the snowpack in the Upper Mississippi and Red River of the North Basins had not begun to thaw but the Little Sioux, Floyd, James, and Big Sioux, tributaries of the middle Missouri River were rising rapidly and were expected to exceed flood stage early in April.

PRECIPITATION.--Heavy snow fell in many parts of the United States early in March. In the Northeast, snow, accompanied by strong gusty winds, accumulated in drifts 5 to 6 feet deep. In New England, the snow collapsed roofs, delayed air and surface transportation, and closed schools and stores. In Kent County, Maryland, snow rollers, an interesting but unusual phenomenon, reached 10 to 12 inches in diameter and 22 inches in length, leaving trails 50 to 60 feet long. Another storm moved across the southern Rocky Mountains early in March. It dumped several inches of snow in southern Utah on the 4th and reached the eastern slope of the Rockies on the 5th. At the end of the first week of March, a Pacific storm lashed the Northwest coast with gales and heavy rain and snow inland to the Rocky Mountains. The snowpack at Paradise Ranger Station accumulated to 255 inches--over 21 feet. Meanwhile, severe thunderstorms dumped substantial rain from Texas to the southern Appalachians with snow in the mountains. One of the worst blizzards in years struck western Kansas on the 7th and 8th. It blocked roads, stranded motorists, downed power and communication lines, and killed several livestock.

A storm in the Southwest dumped 17 inches of snow at Flagstaff, Ariz., on the 10th and 11th, increasing the snow cover to 29 inches. As the moist air moved to the Great Plains it left 7 to 13 inches of snow in the Oklahoma and Texas Panhandles and up to 10 inches locally in southwestern Kansas.

Rain, accompanied by strong winds, beat upon the Washington and Oregon coast shortly after midmonth and showers occurred in northern California, spreading eastward to the Rocky Mountains. Six to 12 inches of snow fell in southern Minnesota, west-central Iowa, Wisconsin, and Upper Michigan near the end of the third week of March.

In the last week of March, a storm moved northeastward from the Missouri Ozarks to northern Maine. Locally heavy rain fell from the Ozark Mountains across the Ohio River Valley to Maryland and southward to the Carolinas. Snow mixed with rain fell along the western edge of the precipitation area and blustery winds, gusting to 30 to 45 m.p.h. from the Dakotas to Texas and eastward to the Atlantic coast, added to the people's misery.

Although snowfall at some locations in the central Great Plains exceeded that of previous seasons, localities elsewhere were exceedingly dry. Milford, Ore., received only 0.29 inch in March, the 2d lowest March total rainfall in their 54-year record. The February-March total at Parkersburg, W. Va., 2.11 inches, was the least in the 84-year record. The January to March period at Williamsport, Pa., was the driest in this century and the 3-month total at Morgantown, W. Va., was the least in 96 years. Above-normal rains fell from northern Arizona to Oklahoma, from Texas to Florida, and along the Atlantic coast as far north as Virginia.

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

R Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

° Includes crop damage
C Crop damage

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
# Freezing drizzle and freezing rain, commonly known as glaze.
ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, ESSA, monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000
7 $5,000,000 to $50,000,000
8 $50,000,000 to $500,000,000
9 $500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

MARCH 1969

Elmer R. Nelson, Office of Hydrology

Extensive flooding occurred in the upper Big Blue River basin in Nebraska during March. Turkey Creek near Wilber, Nebr., exceeded the 10-year record established in March 1960. The West Fork Big Blue River exceeded the 11-year record of March 1960 but was several feet below the historical high water mark of July 1950. Flooding along the mainstem of the Big Blue River generally approached the last heavy March overflows in 1960.

ATLANTIC SLOPE DRAINAGE

Flash flooding occurred on the 25th along small streams in eastern Massachusetts and sections of Connecticut and Rhode Island. This flooding was due to 1.5 to 2.5 inches of rain on the 24-25th. Some basements and roads were flooded. There was some bridge damage. A few families were evacuated from low areas.

Heavy runoff due to snowmelt and moderately heavy rain (1 to 2 inches) on the 25-27th in the Hudson River basin in New York caused small streams and brooks to rise to near bankfull. Wappingers Creek near Wappingers Falls, N. Y., overflowed but no extensive damage resulted. Elsewhere only lowland overflow and minor damage were reported.

Light flooding occurred along streams in New Jersey on the 25-26th due to snowmelt and heavy precipitation on the 25th. The first 2 weeks of March in eastern Pennsylvania and New Jersey were generally cold with below seasonal temperatures. Heavy snowfall occurred on the 2d with amounts ranging from 4 to 8 inches over eastern Pennsylvania (except 12 inches around Easton-Riegelsville area) to 25 to 30 inches in the High Point, N. J., area. A secondary maximum of over 10 inches occurred between Wading River and Toms River, N. J. Amounts of 5 inches or less were reported from around Newark to Trenton, N. J., to Wilmington, Del., and over extreme southern New Jersey. Snowfall of 2 to 4 inches occurred again over New Jersey on the 6-7th. A warming temperature trend during the third week of March produced steady snowmelt for about 1 week. Snowmelt produced steady rises on all streams with the Delaware River cresting at Trenton, N. J., on the 22-23d. Rainfall on the 25th was in excess of 1 inch with higher amounts up to 2.5 inches in the south branch of the Raritan and Millstone Basins and 3 inches over the Passaic. The Passaic at Chatham, N. J., and the Raritan at Manville and Bound Brook, N. J., rose above flood stage on the 25th and receded within their banks on the same date. The Rockaway at Boonton, N. J., and the Millstone at Blackwells Mills, N. J., rose above flood stage on the 25th and receded within their banks on the 26th. The highest crest occurred on the Millstone which was 3.35 feet above flood stage at Blackwells Mills on the 25th. This was slightly higher than in May 1968. Damages from the flooding were minor and of no consequence.

There were two rises to above flood stage on the Neuse and Cape Fear Rivers in eastern North Carolina during March. The first rise was due to 1 to 2 inches of rain on the 6-7th. The crests on the Neuse River ranged from 3.6 feet above flood stage at Smithfield, N. C., on the 9th to slightly above flood stage at Kinston, N. C., on the 18th. The lower Cape Fear River crested 6 to 7 feet above flood stage on the 9th. The second rise was due to heavy precipitation on the 17-18th with rainfall amounts similar to that on the 6-7th. The crests on the Neuse and Cape Fear Rivers were lower than during the first rise. The Roanoke River at Randolph, Va., rose 1.5 feet above flood stage on the 26th from rainfall averaging 1.5 inches over the upper Roanoke and Dan Basins during the 48-hour period ending at 8 a.m. on the 25th. No damage was reported from the flooding.

The Rocky River at Norwood, N. C., rose 2.4 feet above flood stage on the 20th and receded within its banks on the same date. The Lumber River at Lumberton, N. C., continued in flood from January 23 into April. The highest crest (11.2 feet) occurred on March 9 and was 3.2 feet above flood stage. Low swamps and drainage ditches were affected. Swamps along the Little Pee Dee River at Galivants Ferry, S. C., have been under water since the latter part of October 1968. It reached the 9-foot flood stage on March 12 and fell below on the 15th.

The middle portion of the Great Pee Dee River was high all month and in flood for 21 days. The two crests exceeded flood stage by slightly more than 1 foot.

Minor flooding occurred on the Saluda River at Chappells, S. C., and on the Broad River at Blair, S. C., between the 19th and 27th. The flooding was due to rainfall ranging from 1.75 to over 2.5 inches on the 18th and 19th. Damage was limited to pastureland.

Light flooding began on the Savannah River at Clyo, Ga., on the 25th and continued in flood to Apr. 9. It crested on Apr. 3, 1.5 feet above flood stage. Flood damage, if any, was light.

The Satilla River near Atkinson, Ga., rose above flood stage on March 19 and continued in flood to April 7. The crest on the 30th was 2.1 feet above flood stage.

EAST GULF OF MEXICO DRAINAGE

Heavy rains on the 16-19th produced rapid rises to near flood stage on the Chattahoochee and Flint Rivers in Georgia. Additional heavy rains on the 24th caused the Apalachicola River at Blountstown, Fla., to exceed flood stage on the 26-29th. The crest on the 28th was nearly 2 feet above flood stage. The total preliminary estimated damage by the Corps of Engineers was placed at slightly over $12,000.

Minor flooding occurred on the East Fork Tombigbee at Fulton, Miss., and on the Tombigbee at Jackson Lock and Dam, Ala., between the 25th and 30th. This flooding was due to moderate rains on the 18th and 19th followed by heavier rains on the 24th. No damage resulted

Heavy rains (1.5 inches) on the 3d-5th caused the Pearl River to rise above flood stage at Bogalusa, La., on the 9th. Additional heavy rain (2 inches) on the 15-18th caused an additional rise to above flood stage at Jackson, Miss., on the 20th and at Pearl River, La., on the 21st. Heavy rain (2 inches) on the 25th caused a further rise to above flood stage at Monticello, Miss., on the 25th. The crests on the 26-30th ranged from 1.7 feet above flood stage at Monticello to 6.3 feet above flood stage at Jackson, Miss. Flooding continued into April, except at Monticello which receded within its banks on the 28th. The Corps of Engineers estimated damages along the Pearl River during March as near $185,000.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--Heavy snow accumulated over the Upper Midwest by midwinter which was one of the worst winters on record. Most of Minnesota received more than double the normal precipitation for the 5-month period of October through February. The total snow depth as of March 10 averaged more than 20 inches over the northern one-half and southwestern

one-third of Minnesota. In the northern one-half of Wisconsin and the northwestern portion of Iowa, the snow depths ranged from 10 to 20 inches. The water equivalent of the snow cover was the heaviest in the Minnesota River Basin and ranged from 4 to 10 inches. In the Mississippi Basin above St. Paul, Minn., the water equivalent ranged from 4 to 8 inches. Below St. Paul, Minn., to Guttenburg, Iowa, the water equivalent of the snow cover ranged from 2 to 5 inches. In the St. Croix, Chippewa, and upper Wisconsin River Basins it ranged from 5 to 7 inches and in the middle and lower Wisconsin Basin from 1 to 5 inches.

Precipitation during March in the upper Mississippi Basin continued the same below normal pattern as in February. The heaviest precipitation occurred in the southwestern quarter of Minnesota, the same as in February. New snow of 7 to 10 inches with water equivalent of more than 1 inch occurred on March 19-20 over the Minnesota area of the upper Des Moines Basin. Rains of March 23-24 amounted to 1 inch or more in the southern one-third of Iowa, decreasing to 0.5 inch or less over the northern one-third.

Temperature wise, the first week of March continued the above normal pattern established during the last 8 days of February. The next 9 days were below normal followed by a 5-day period of above normal. The last 6 days of March were below normal with the last 4 days as much as 30° below normal in many locations. Subzero temperatures were prevalent over most of Minnesota with many daily record minimum temperatures exceeded on the 29th, 30th, and 31st. Temperatures were actually the coldest of record for so late in the season.

The relatively warm temperatures on March 17 through March 25 caused considerable snowmelt runoff in the lower Minnesota Basin, and in the Le Sueur and Blue Earth River Basins. The subzero temperatures during the last 4 days of March temporarily stopped the melting of the snowcover. The Minnesota River at Mankato, Minn., crested at a stage of 18.1 feet, 0.9 foot below flood stage on March 28. It receded to a stage of 14.5 feet before it started to rise again on April 1. It rose above flood stage at Jordan and Chaska, Minn., on March 28 and at Savage, Minn., on March 30. It continued in flood into April. It crested at Jordan, Minn., 4 feet above flood stage on March 31 to April 1. The Trempealeau River at Dodge, Wis., reached, but did not exceed, flood stage on March 26. The Kickapoo River at Steuben, Wis., was out of its banks on the 25-28th. The crest on the 27th was 0.7 foot above flood stage.

Warm weather over central and southeastern Iowa on March 15 through March 23 caused rapid erosion of the snow cover over the Cedar, Skunk, Iowa, and lower Des Moines Basins. The snowmelt runoff caused extensive flooding along the South Raccoon and North Rivers, the entire Skunk River System, the West Fork of the Cedar, Black Hawk Creek, and along the Iowa River from Marshalltown, Iowa, to its mouth. Cold weather from March 24 through the end of the month stopped further melting of the snowcover.

The Salt River at New London, Mo., rose 0.9 foot above flood stage on the 25th and receded within its banks on the same date. The Sangamon River at Riverton, Ill., was out of its banks on the 25-30th. The crest on the 28th was 2.7 feet above flood stage. The Kaskaskia River at Carlyle Dam (TW), Ill., continued in flood from February 3 to March 13. The crest on February 21 was 4.3 feet above flood stage.

Missouri Basin.--Ice jams on the Sun and Teton Rivers and on Belt Creek in Montana caused localized flooding and damage to several bridges and other structures during the latter half of the month. Snowmelt runoff caused streams and creeks in the Great Falls, Helena, Denton, and Dillon, Mont., areas to run at a high level. The high water caused the death of a 4-year old boy near Stockett, Mont. The flooding was due to a combination of ice jamming and snowmelt runoff. Precipitation was generally light throughout the month and was not a contributing factor. Most of the damage was due to ice piling against bridge piers and spans.

Overflows, due to ice jamming, occurred along the Yellowstone River from Miles City, Mont., downstream to Sidney, Mont., on the 19th-21st. Most of the overflow was confined to low areas. The heaviest damage occurred to crops and buildings and was estimated to range from $200,000 to $300,000. Ice jams occurred on the Little Big Horn River, 5 miles upstream from Hardin, Mont. The overflow reached the interstate highway but little or no damage resulted.

Ice jams on the White River in South Dakota and the Niobrara River in Nebraska may have caused some local overflows but there was no reported damage or livestock loss. The Grand River between Shadehill and Little Eagle, S. Dak., was near bankfull late in March but did not overflow.

The Floyd River rose 2 to 3 feet below bankfull at Alton, Iowa, on the 27th, and near bankfull stage at James, Iowa, on the 24th and 28th. Minor rises also occurred on the southern reaches of the Big Sioux, Vermillion, and James Rivers during the last few days of March but remained less than one-half bankfull.

Temperatures during March were cold, particularly in the eastern half of South Dakota. Some locations reported near record low March temperatures. West of the Missouri River, in South Dakota, several warm days after mid-March depleted most of the snow cover.

The month began with a snow cover ranging from 5 inches in central South Dakota up to about 40 inches in southwestern Minnesota. At the end of March the snow on the ground measured a trace at Sioux City, Iowa, to 12 inches in northwestern Iowa; 10 to 25 inches in southwestern Minnesota; 8 to 16 inches in eastern South Dakota; up to 5 inches in central South Dakota; and 2 inches or less in western South Dakota and eastern Wyoming, except at higher elevations.

Changes in the water equivalent of the snow cover during March was less pronounced, as most of the snowmelt was absorbed in the snow. At the end of the month, the water equivalent was up to 7 inches in the Floyd River Basin; 3 to 8 inches in the Big Sioux and Rock River Basins, with the heaviest amount in the Flandreau, S. Dak., area; 4 to 7 inches in the Vermillion and James Basins; and generally less than 3 inches along the Niobrara River in Nebraska and the rivers west of the Missouri River in South Dakota.

Minor flooding occurred along the Elkhorn River near Scribner, Nebr., on the 21st due to a minor ice jam. One county road was briefly inundated in the Scribner area but no damage resulted. Near bankfull stage was reached at Norfolk, Nebr., on the 21st and at West Point, Nebr., on the 22d. The crests were 1.5 feet and 0.8 foot below flood stage, respectively. By the end of the month, rivers and streams with the exception of Logan Creek were running open and free of ice. Very little snow remained except in drifts and piles, although there remained a great deal of ponded water.

A heavy snow cover extended over most of the Loup and Platte River Basins in eastern Nebraska and over the Little Sioux River Basins in northwestern Iowa in the beginning of March. Very little snowmelt occurred

during the first half of the month as the temperature remained well below normal. During the last half of the month, there were three warm periods followed by cool periods which retarded some snowmelt. Some runoff occurred in the lower reaches of most streams. Local flooding occurred in the lower reaches of the Wood River in Nebraska but it was confined mostly to lowlands and croplands with some highwater over rural roads. The mild spell in mid-March caused snowmelt in the lower reaches of the Loup River Basin with some lowland flooding due to ice jams near St. Paul, Fullerton, and Columbus, Nebr., on the 19-25th. Minor ice jams and flooding occurred on the Platte River near Schuyler, Nebr. Flood damage was relatively minor and occurred mostly in the lower reaches of the Loup River between St. Paul and Columbus, Nebr.

There were three rises to above flood stage on the Nishnabotna at Hamburg, Iowa. The first rise occurred on February 25 to March 4, the second, on March 17-21 and the 3d, on March 25-26. The highest crest occurred on the 18th and was 7.25 feet above flood stage. No major damage resulted from any of the rises.

Extensive flooding occurred in the upper Big Blue River Basin in Nebraska from snowmelt on the 18-26th. Considerable overflow developed on the Little Blue River at Deweese and Fairbury, Nebr., on the 18th-21st.

Turkey Creek near Wilber, Nebr., reached a crest of 15.3 feet on the 20th which exceeded the 10-year record of 14.92 feet of March 1960. The West Fork Big Blue River near Dorchester, Nebr., exceeded the 11-year record of 20.28 feet of March 1960 but fell considerably short of the historical high water mark of 24.8 feet in July 1950. Flooding along the mainstem of the Big Blue River generally approached the last heavy March overflows in 1960 as far downstream as the Kansas border. Widespread snowmelt surface water accumulations on the tributary streams drained off very slowly. Currents in the tributaries, carrying considerable ice, were quite slow. Flooding developed from 2 to locally 5 inches of water equivalent in the old snow cover. Precipitation of 0.5 to 1 inch on the 23d-25th in the lower basin served principally to slow falling stages. Damages were locally substantial along the Big Blue at Seward, Nebr., and on the Little Blue in the Fairbury area, but generally losses were light to moderate and confined to the Nebraska portion of the basin.

The Blackwater River at Valley City, Mo., exceeded flood stage by 7.5 feet on the 24th. It was out of its banks from the 23d to the 26th. No major damage resulted.

Some flooding occurred along the Osage River at Schell City, Mo., between the 26th and 30th. The crest on the 28th was 3.1 feet above flood stage. No damage of consequence resulted from the overflow.

Ohio Basin.--Heavy rain on the 24th caused the Little Wabash River at Wilcox, Ill., to rise above flood stage on the 25-27th. The crest on the 26th was 0.6 foot above flood stage. The Saline River at Harrisburg, Ill., was out of its banks on the 24-25th. The crest was 3.1 feet above flood stage on the 25th.

White Basin.--The Black River at Black Rock, Mo., rose above flood stage on March 24 and continued in flood to April 1. The crest on March 25 was 3 feet above flood stage. The Cache River at Patterson, Ark., continued in flood from December 23 to March 16. The crest on February 1 was 4.3 feet above flood stage. It rose above flood stage again on March 24 and continued in flood into April. The highest stage reached on March 31 was 1.2 feet above flood stage. The White River at Georgetown, Ark., continued in flood from January 31 to March 10. The crest on February 4 was 5.7 feet above flood stage. At Des Arc, Ark., it continued in flood from January 30 to March 2. The crest on February 5 was 6.5 feet above flood stage. At Clarendon, Ark., it rose above flood stage on December 27 and continued in flood into April. The crest on February 7 was 6 feet above flood stage and 3 feet higher than in January. At St. Charles, Ark., it continued in flood from January 3 to March 21. The crest on February 12 was 5.1 feet above flood stage which was considerably higher than in January. Overflow on the White, Black, and Cache Rivers was light and caused only minor damage.

Arkansas Basin.--Light flooding occurred on the Little Caney River, Bird Creek, Neosho, Illinois, Fourche Maline, and Poteau Rivers in Oklahoma on the 23d-27th. This was the first flooding in the northern areas since March and April 1968. Some flooding occurred along the other streams within the last 2 months. No damages were reported as the areas affected were mostly lowlands.

Red Basin.--The Sulphur River at Naples, Tex., continued in flood from February 20 to March 4. The crest on February 25 was 6.6 feet above flood stage. Further upstream at Hagansport, Tex., the Sulphur rose above flood stage on March 3 and continued in flood to March 12. The crest on March 4 was 3.5 feet above flood stage. There were three other rises at Hagansport, Tex., to above flood stage during March, namely, 15th-22d, 23d-27th and 31st-April 2. The crests on the 18th and 24th were the highest and about 7.5 feet above flood stage. It rose above flood stage again at Naples, Tex., on March 20 and continued in flood to April 3. The crest on March 28 was 5.2 feet above flood stage.

Further to the north in southeastern Oklahoma, the Blue, Clear Boggy, and Kiamichi Rivers rose 2 to 3 feet above flood stage on the 24-26th. Light flooding occurred on Cypress Creek at Jefferson, Tex., on March 22-April 7.

Atchafalaya Basin.--The Atchafalaya River at Morgan City, La., was out of banks from February 22 to March 8. There were two crests, the higher of which was 0.3 foot above flood stage. No damage resulted from the minor flooding.

WEST GULF OF MEXICO DRAINAGE

The Calcasieu River at Hineston, La., rose above flood stage on March 17 and continued in flood to March 24. It crested on the 19th, 2.2 feet above flood stage.

The Sabine River in northeastern Tex., rose above flood level at Gladewater, on February 18 and at Mineola, Tex., on February 22. It continued in flood at Gladewater until March 9 and at Mineola until March 13. It rose out of its banks at Longview, Tex., on March 5 and receded within its banks on March 10. Heavy rains caused additional flooding in the headwaters and in the middle and lower reaches between March 16 and March 24. Flooding continued into April. Crests ranged up to 7 feet above flood stage at Gladewater.

Flooding continued from February over the lower Sabine, the Neches, the lower Trinity, and the San Jacinto Basins in Texas. The Trinity at Liberty, Tex., receded within its banks on the 2d and the Neches at Beaumont on the 3d. Heavy rains on the 15th to the 18th and on the 23d and 24th caused additional flooding on these streams. The Angelina River near Alto, Tex., rose to flood stage on the 20th and continued at that

level to the 21st. The Navasota River near Easterly, Tex., exceeded flood stage by about 2 feet on the 16-20th and again on the 25-28th. The San Jacinto at Lake Houston, Tex., exceeded the spillway elevation from December 1 into April. The crest of 46.2 feet on the 19th was 0.5 foot lower than on February 23.

Heavy rainfall from the 14th through the 16th caused some minor flooding of the Guadalupe, Navidad, and Lavaca River lowlands between the 16th and 20th. The rainfall ranged from 2 inches to about 3.5 inches. No damage was reported.

PACIFIC SLOPE DRAINAGE

March was a dry month over California with generally less than 50% of normal precipitation. Much of the precipitation in mountain areas was in the form of snow.

High flows continued on the San Joaquin River through March, due largely to reservoir releases to provide storage space for snowmelt runoff later this season. The San Joaquin River at Mendota, Calif., was above flood stage, but well within the levee system much of the month. Due to release of water from the Terminus, Success, and Isabella Reservoirs, the flooding in the normally dry Tulare Lake Basin increased markedly.

The San Joaquin River at Vernalis, Calif., receded below the danger level of 29 feet on March 19 for the first time since mid-January. By the end of March, the river had only dropped 0.6 of a foot below the danger level. The river was still too high to permit reconstruction of damaged levees and drainage of the flooded areas near Vernalis, Patterson, and the mouth of the Stanislaus.

A moderate crest moved down the Sacramento River early in the month. Very slowly falling stages followed as reservoir operators maintained substantial releases to drop back to required flood control space or below. Overflow occurred at Colusa, Tisdale, and Fremont Weirs in the beginning of the month, but by the 9th, overflow had ended at all weirs.

In the delta on flooded Sherman Island pumping was continuing with the water level dropping about 0.1 foot per day. Since the levee closure the water level had decreased about 5 feet. In parts of the island, the water level had been almost 20 feet deep.

Columbia Basin.--Snow course measurements made near the end of March by the Soil Conservation Service indicated the basin snowpack to range from near to well above average. Near average water equivalent was noted at courses in the upper Okanogan, headwaters of the Columbia in British Columbia, western Montana, and the upper Snake River in Wyoming.

The snowpack in southern Idaho ranged from 125% to 175% of the April 1 average. In Oregon, snowcover ranged from 115% of average in northeastern Oregon and the upper Deschutes to 165% in southeastern Oregon. Washington Cascade snow courses showed a water equivalent of 125% to 175% of the 15-year April 1 average, and in northeast Washington and northern Idaho water equivalent of the existing snowpack was about 130% of average.

Minor streams approached flood stage in eastern Idaho. Low-lying, poorly drained sections in Minidoka, Butte, and Jefferson Counties and adjacent areas were subjected to considerable surface flooding during March, closing roads and overflowing farmland.

March was a cool, dry month in the lower Columbia Basin. As a consequence, monthly streamflow was generally below average. A week-long warm spell towards the end of March in the interior sections increased streamflows which continued into April.

FLOOD STAGE DATA

(All dates in March unless otherwise specified) MARCH 1969

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G.C.T.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun.

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

U Indicates Urban sites.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

The solar radiation data in this table form the basis for the analyses in Charts VII. A, and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a. m.) at Palmer, Alaska

MARCH 1969

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	-73	-49	-42	-69	-25	-28	-34	-15	-28	24	7	-32	-16	-29	-10	10	23	35	10	38	-13	10	56	11	4	43	39	51	60	30	3	-0.3

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the ESSA, Weather Bureau.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (<3900 Å) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	16.28	18.55	12.92	18.25	13.52	11.15	15.49	18.95	19.44	19.64	19.74	18.06	18.25	19.64	18.65	15.29	16.77	13.81	10.95	9.27	19.74	14.01	3.94	4.24	8.54	20.13	6.90	13.71	18.06	20.33	7.30	14.88

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the ESSA, Weather Bureau.

TOTAL OZONE DATA

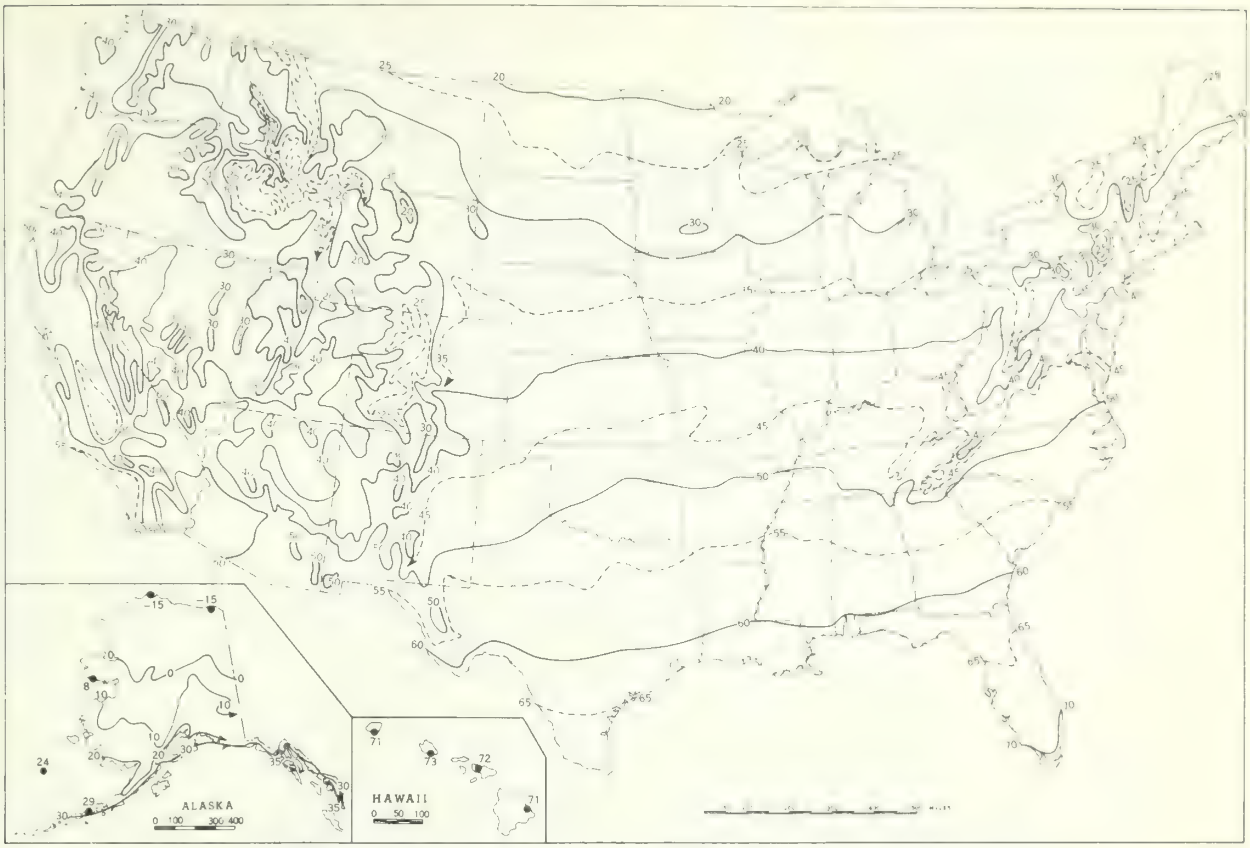
These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code $\lambda s \Omega \Omega \Omega$ defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

Station	Day of month																															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i e , the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded $\Omega \Omega \Omega$) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e g , 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), March



B. Temperature Departure from 30 - Year Mean (°F 1931-60), March 1969.

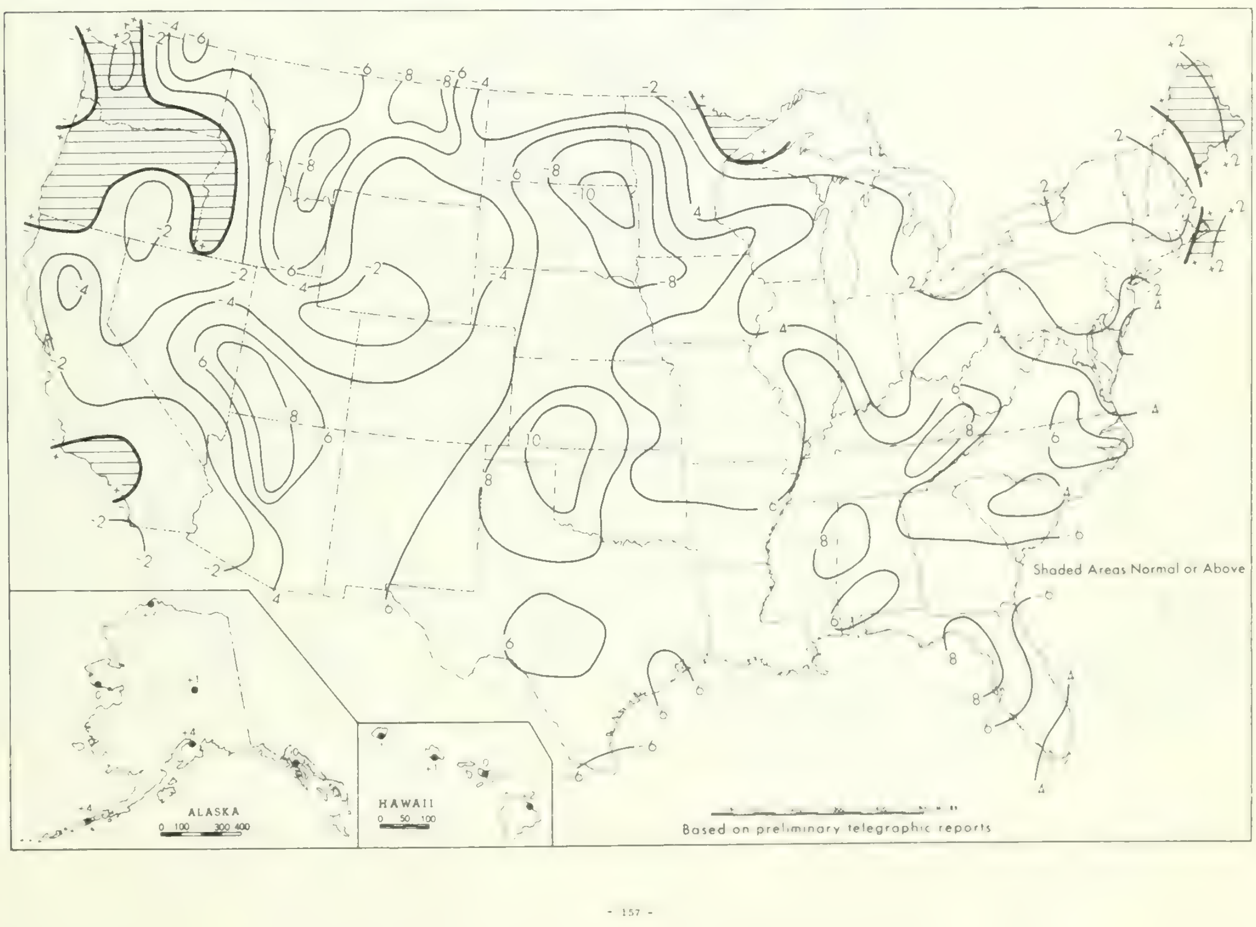


Chart II. Total Precipitation (Inches), March 1969.

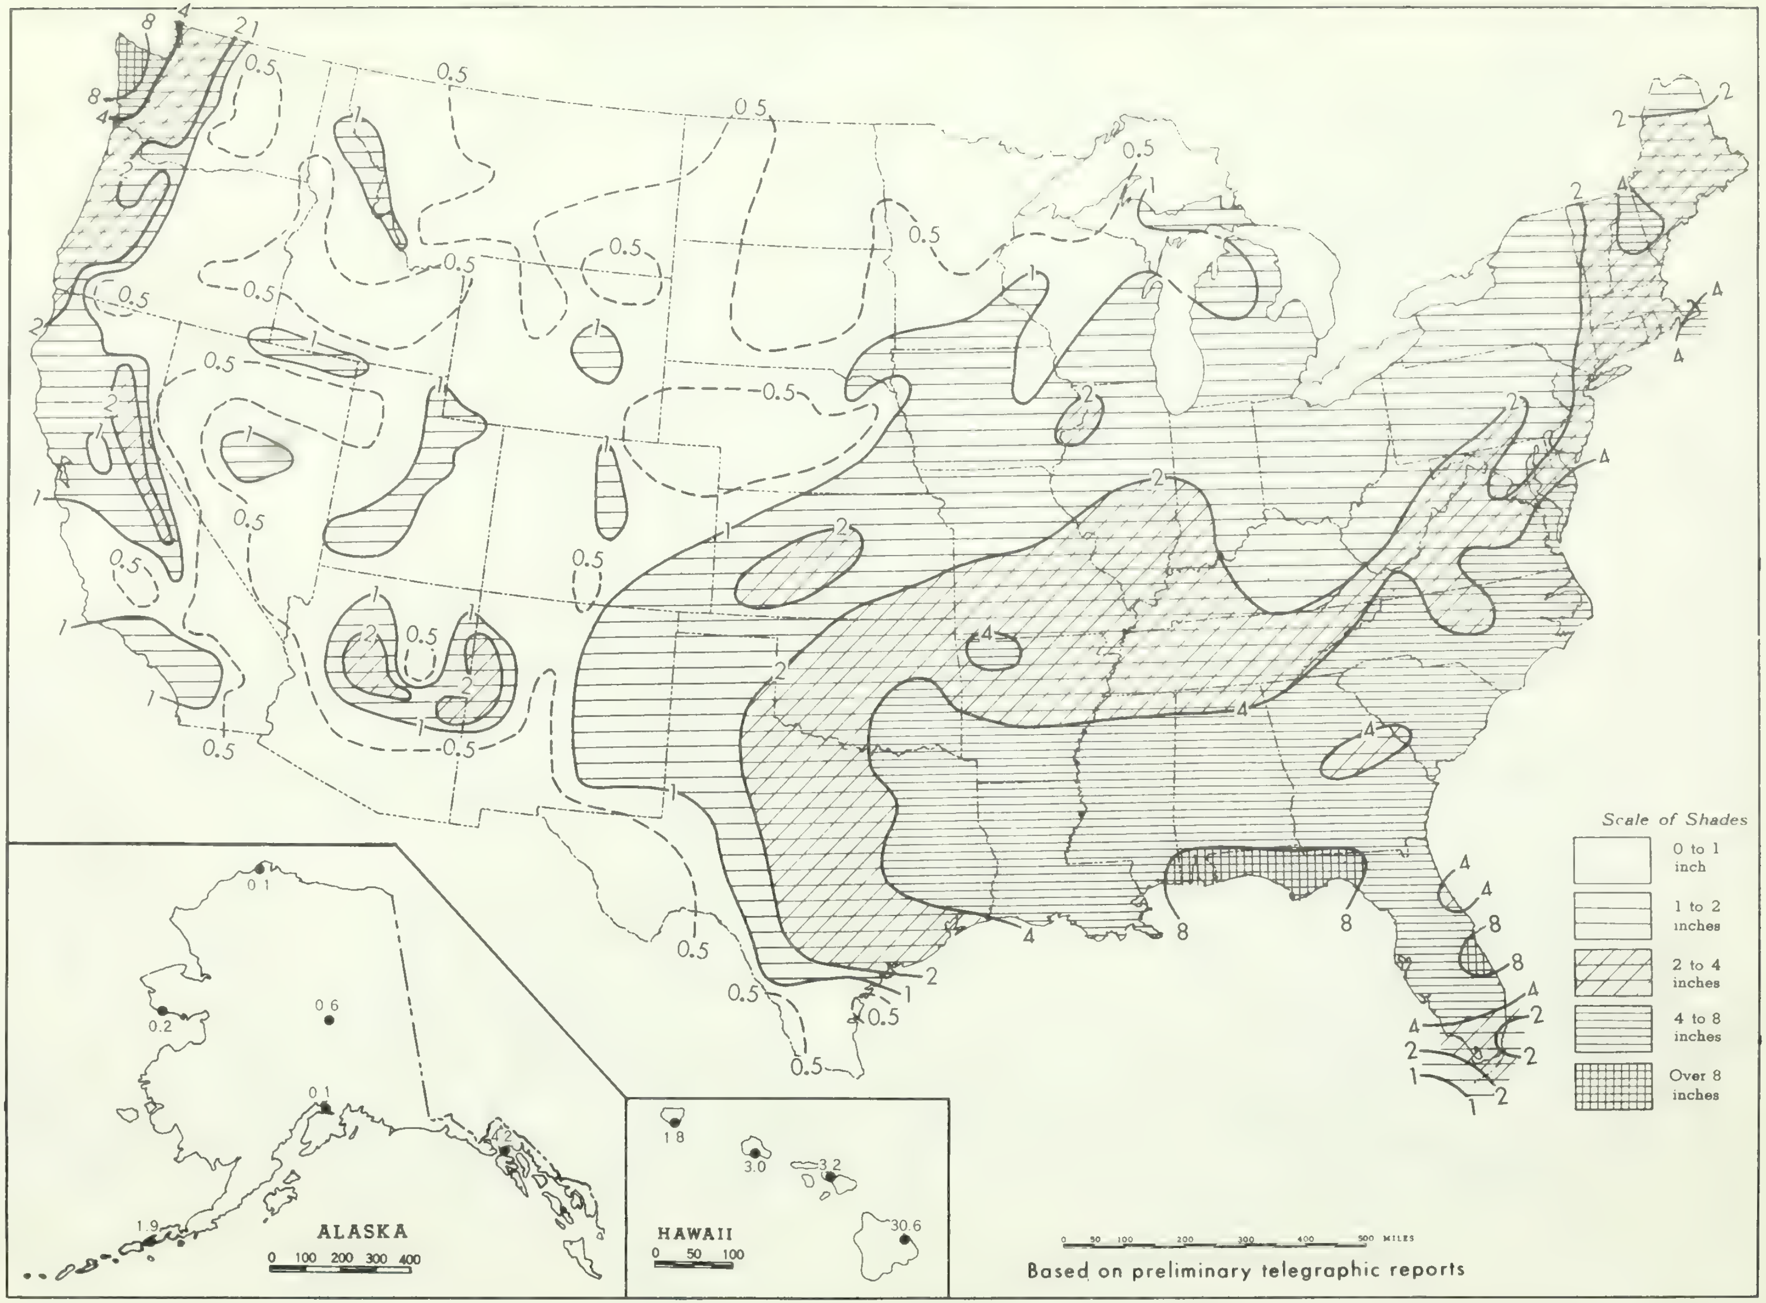

Chart III. Percentage of Normal Precipitation, March 1969.

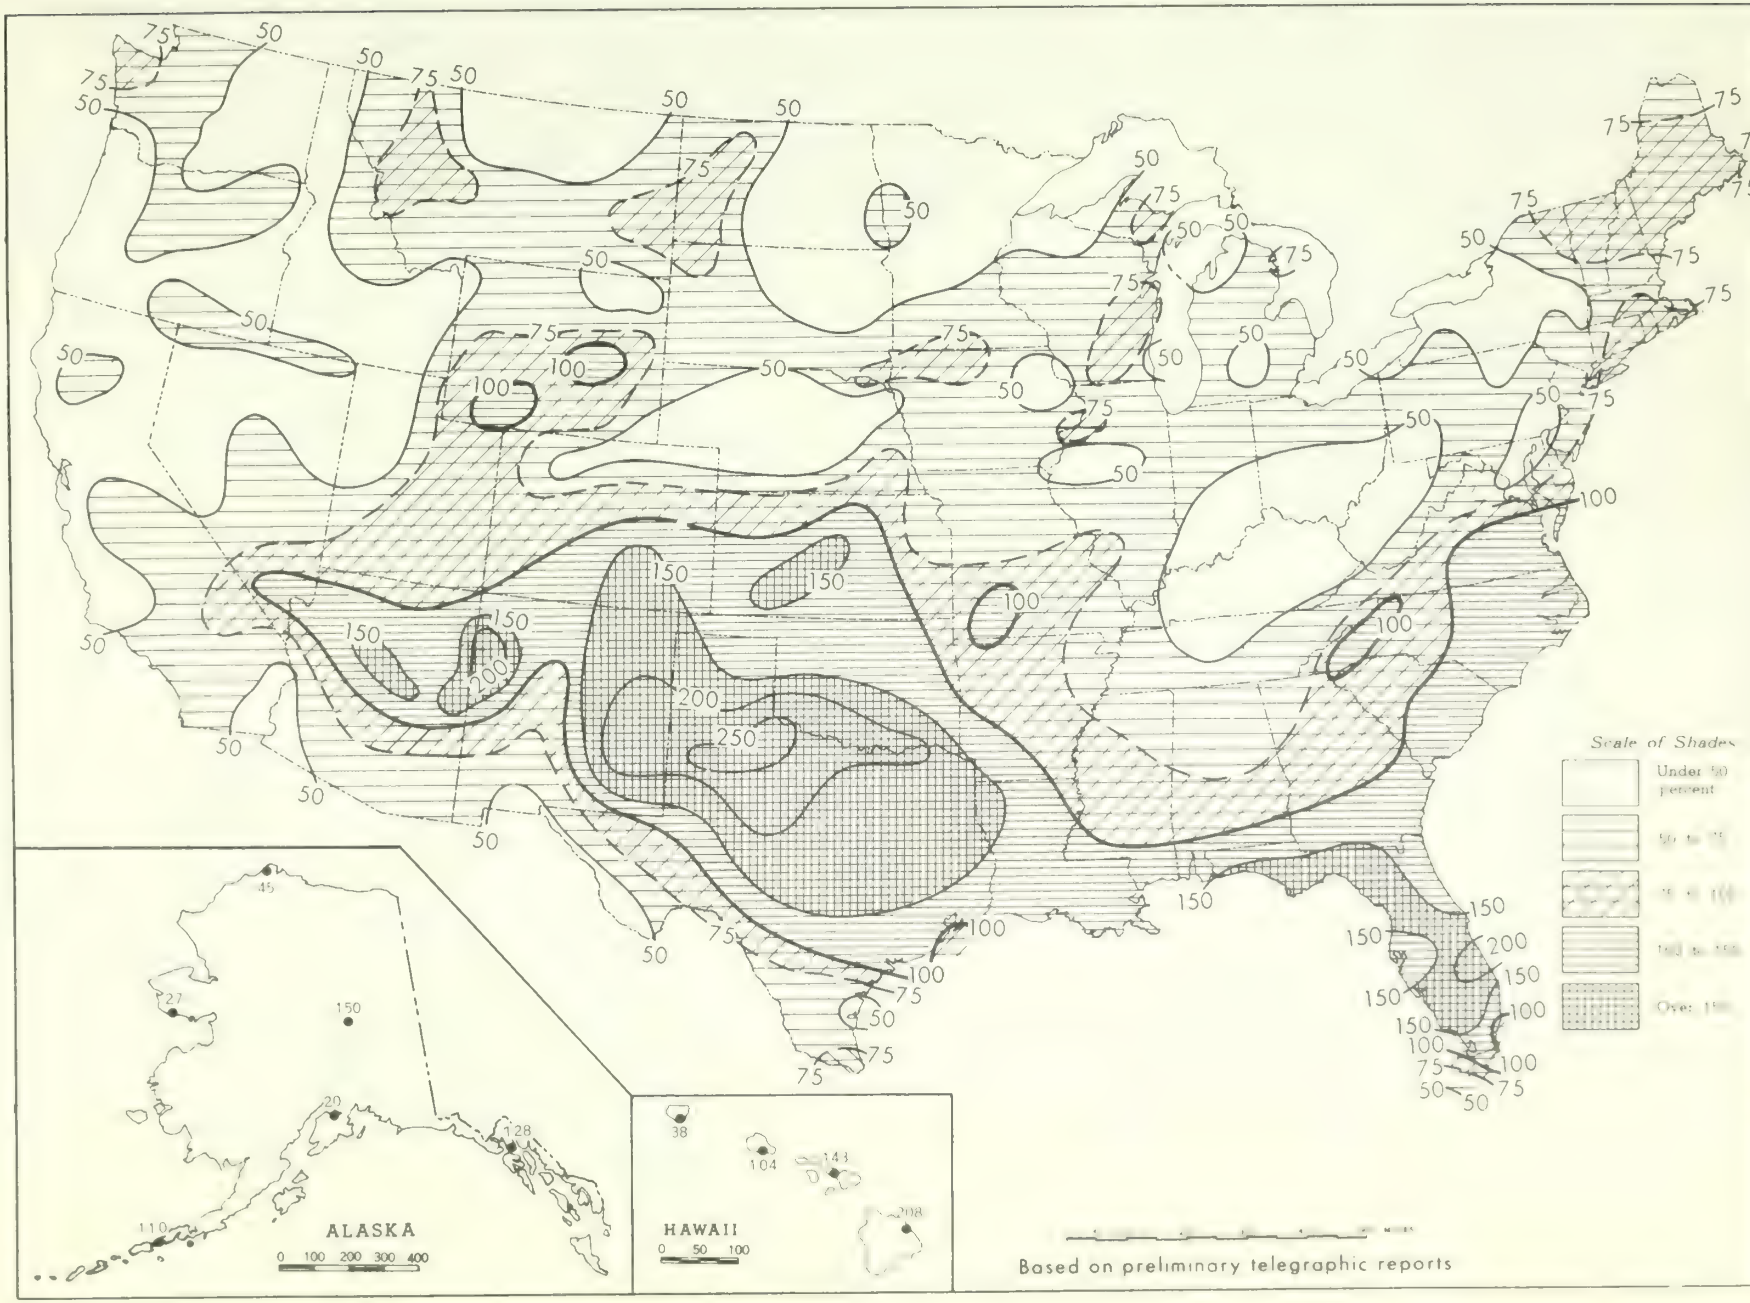

Chart IV. Total Snowfall (Inches), March 1969.

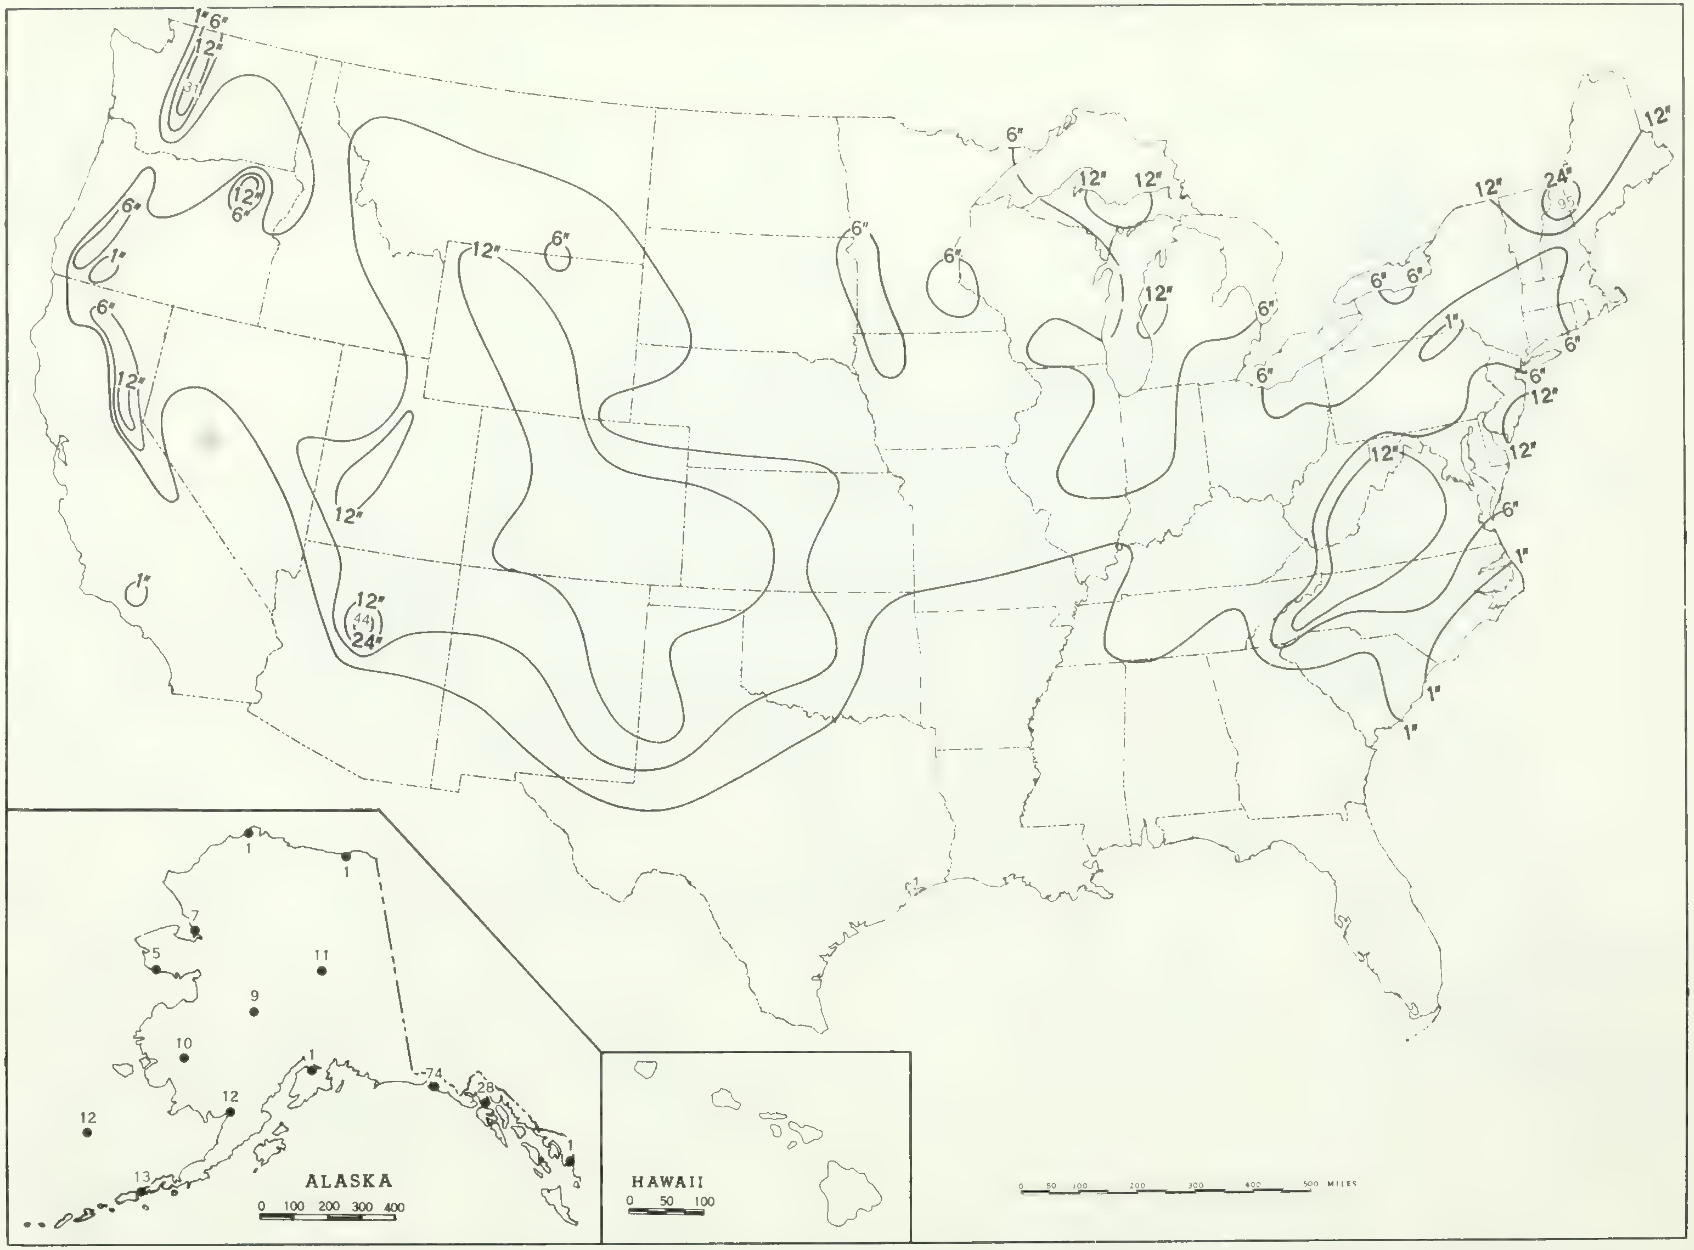
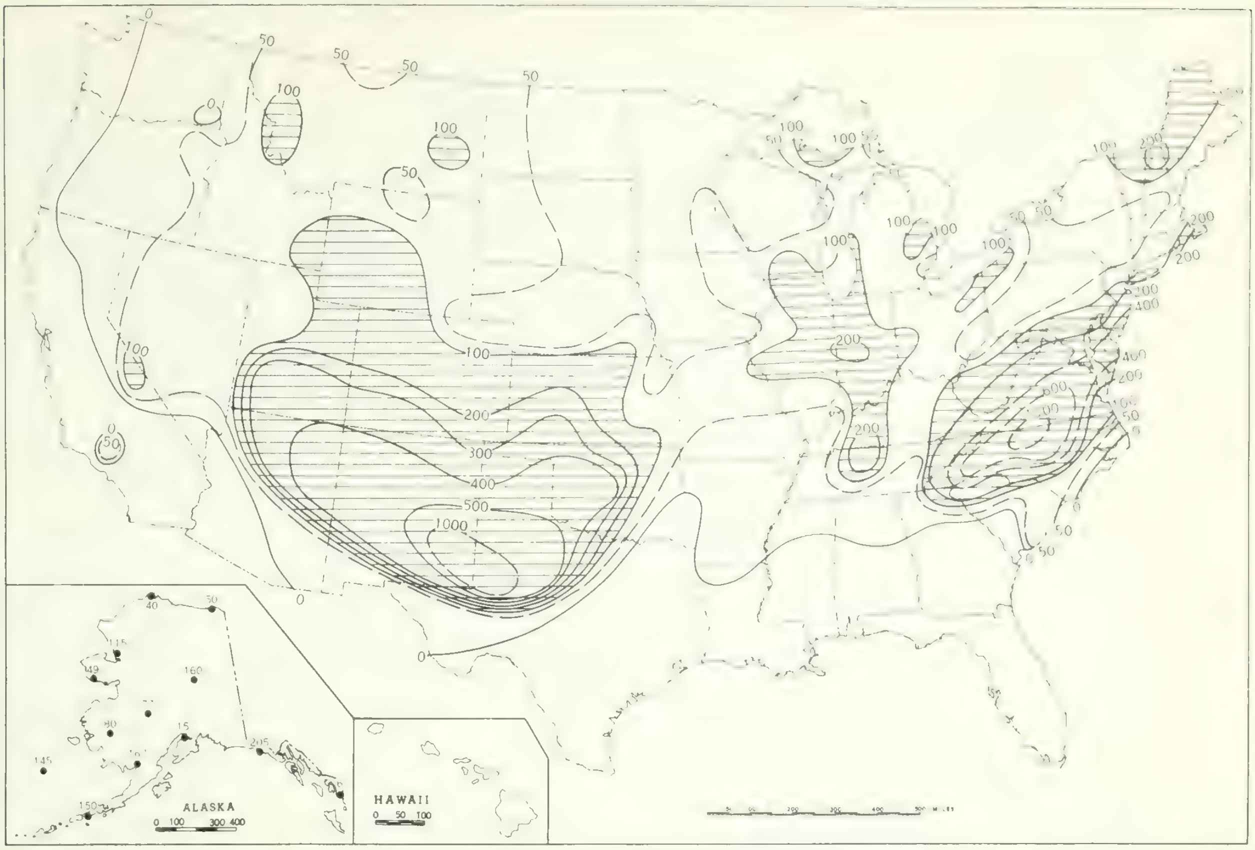
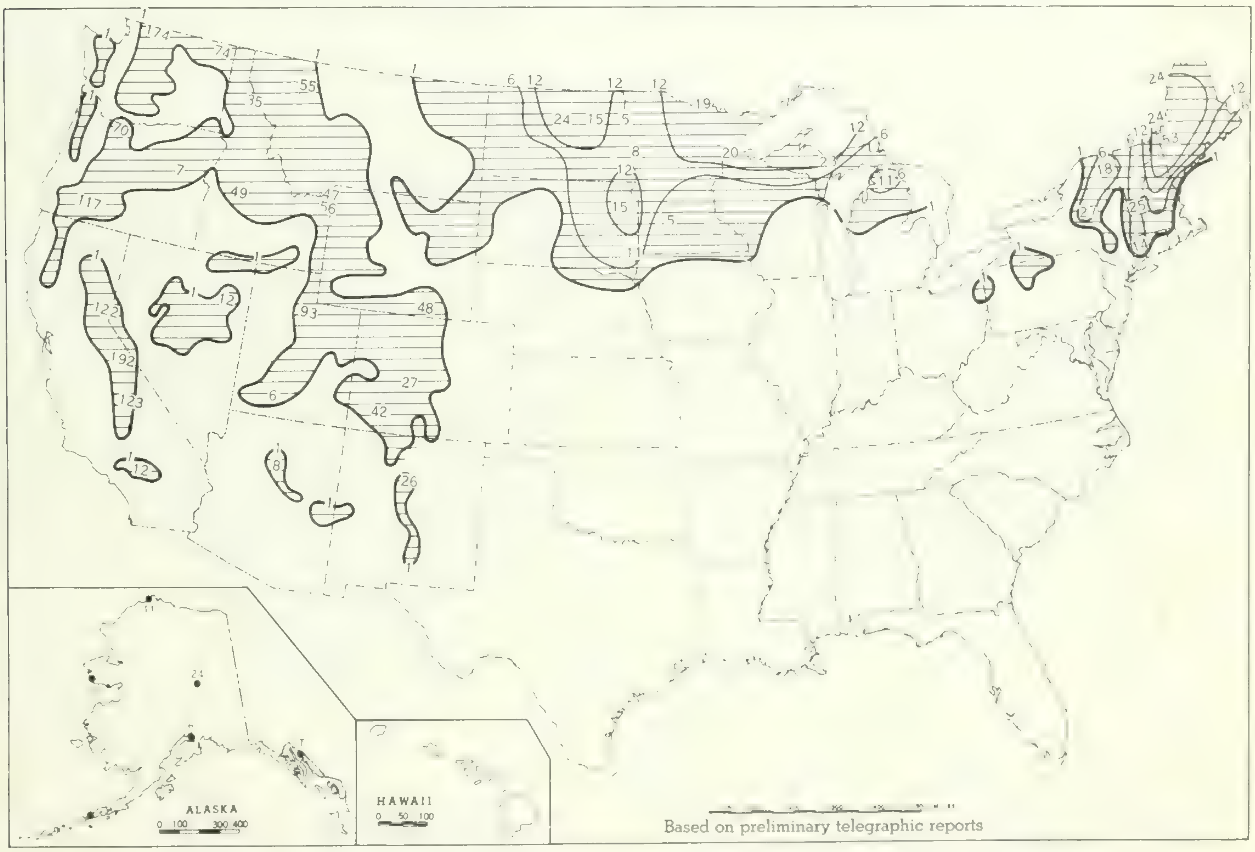


This is the total of unmelted snowfall recorded during the month at Weather Bureau and selected cooperative stations. This Chart and Chart V are published only for the months of November through April, although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, March 1969.

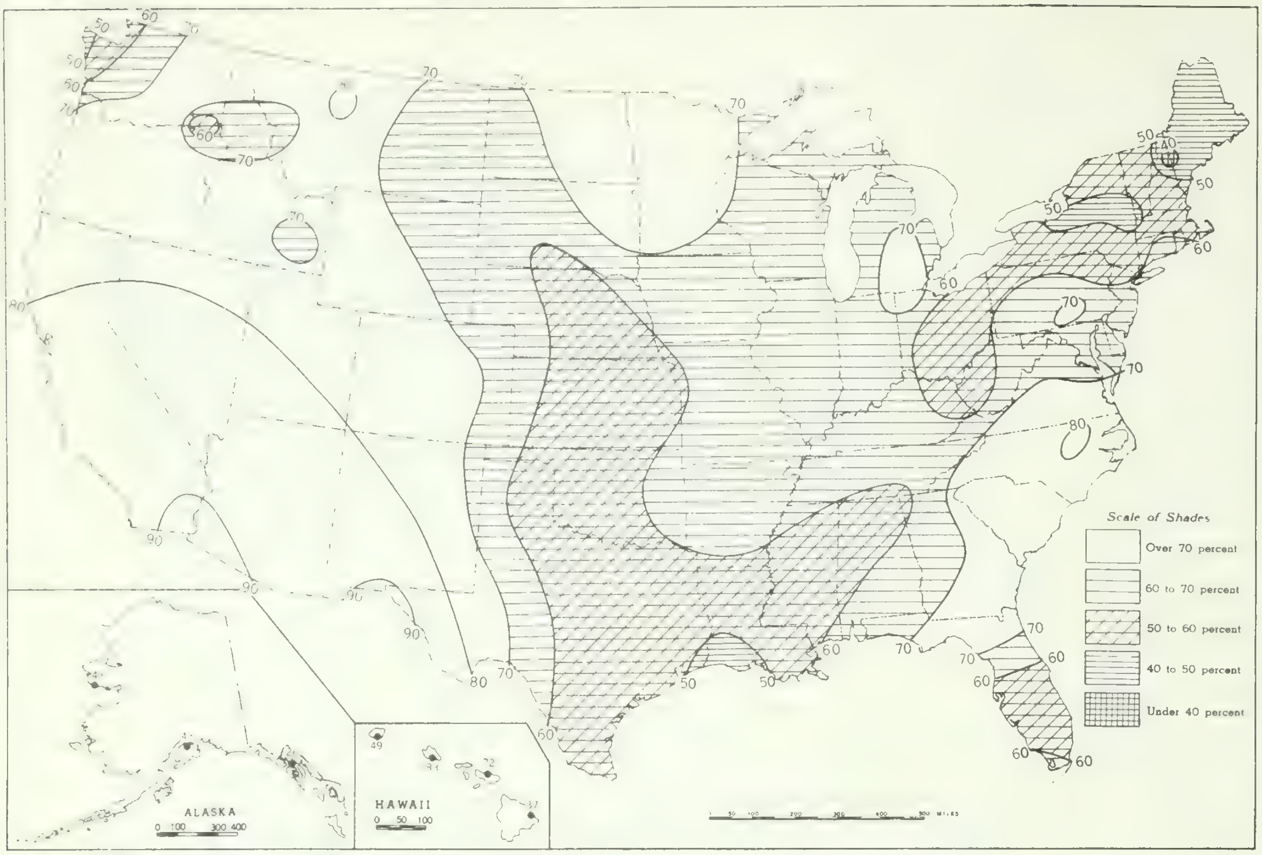


B. Depth of Snow on Ground (Inches), 7:00 a.m. E. S. T., March 31, 1969.

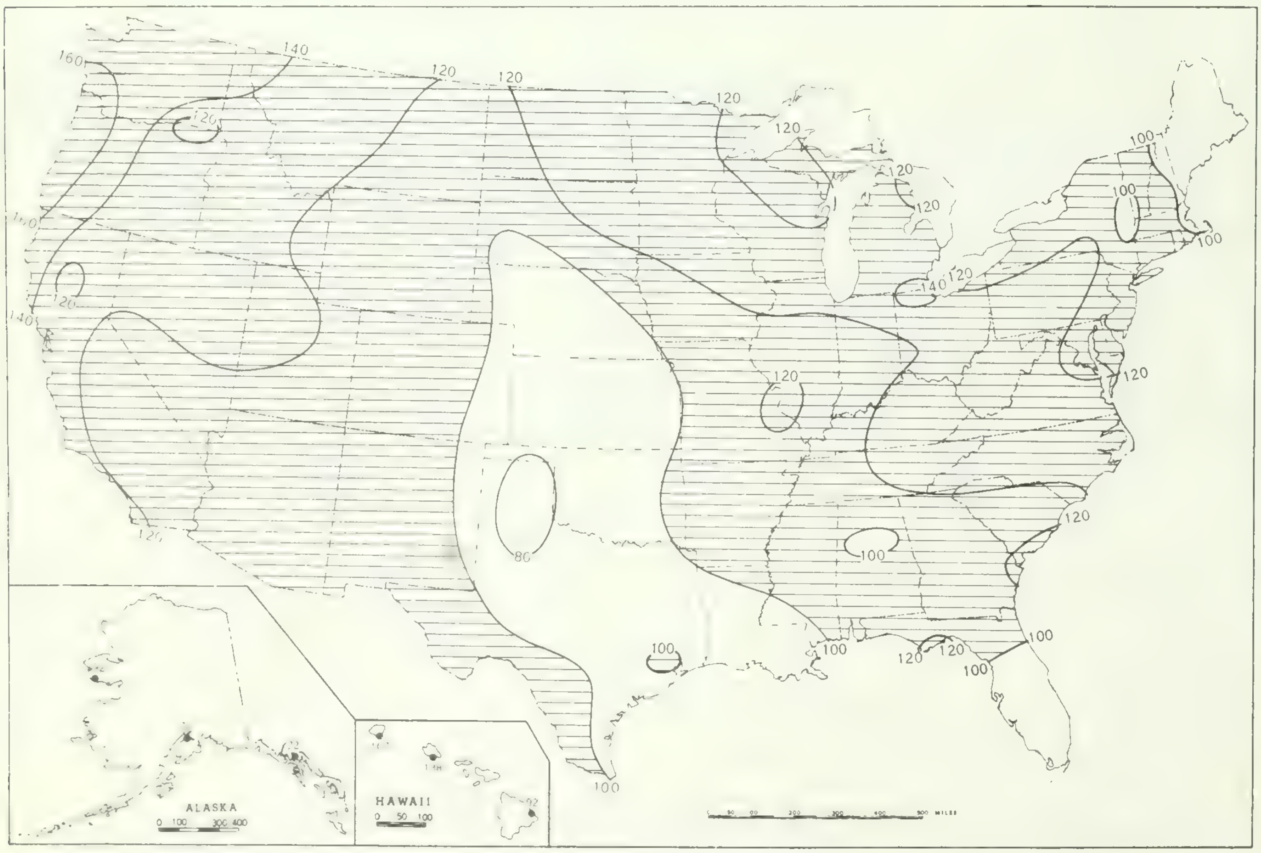


A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a.m. E.S.T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and selected cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, March 1969.

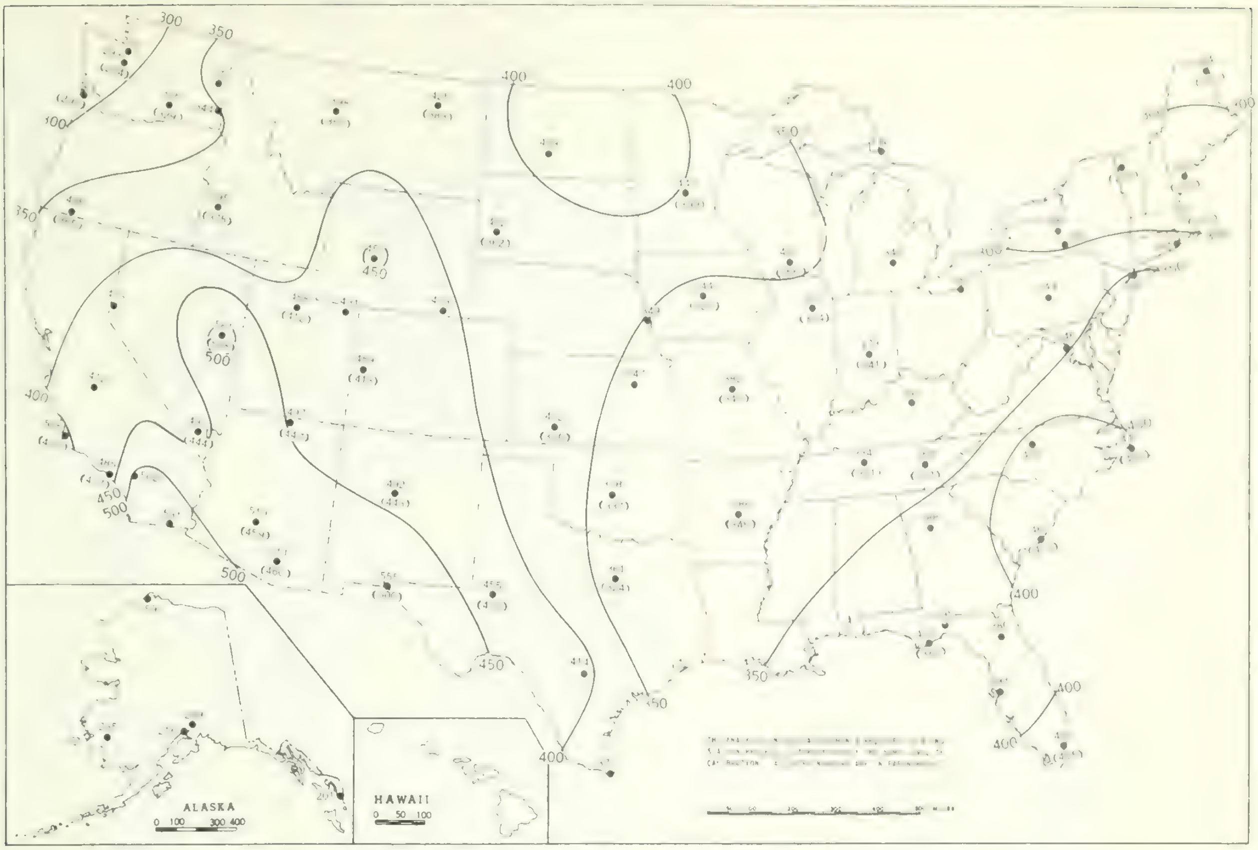


B. Percentage of Mean Monthly Sunshine, March 1969.

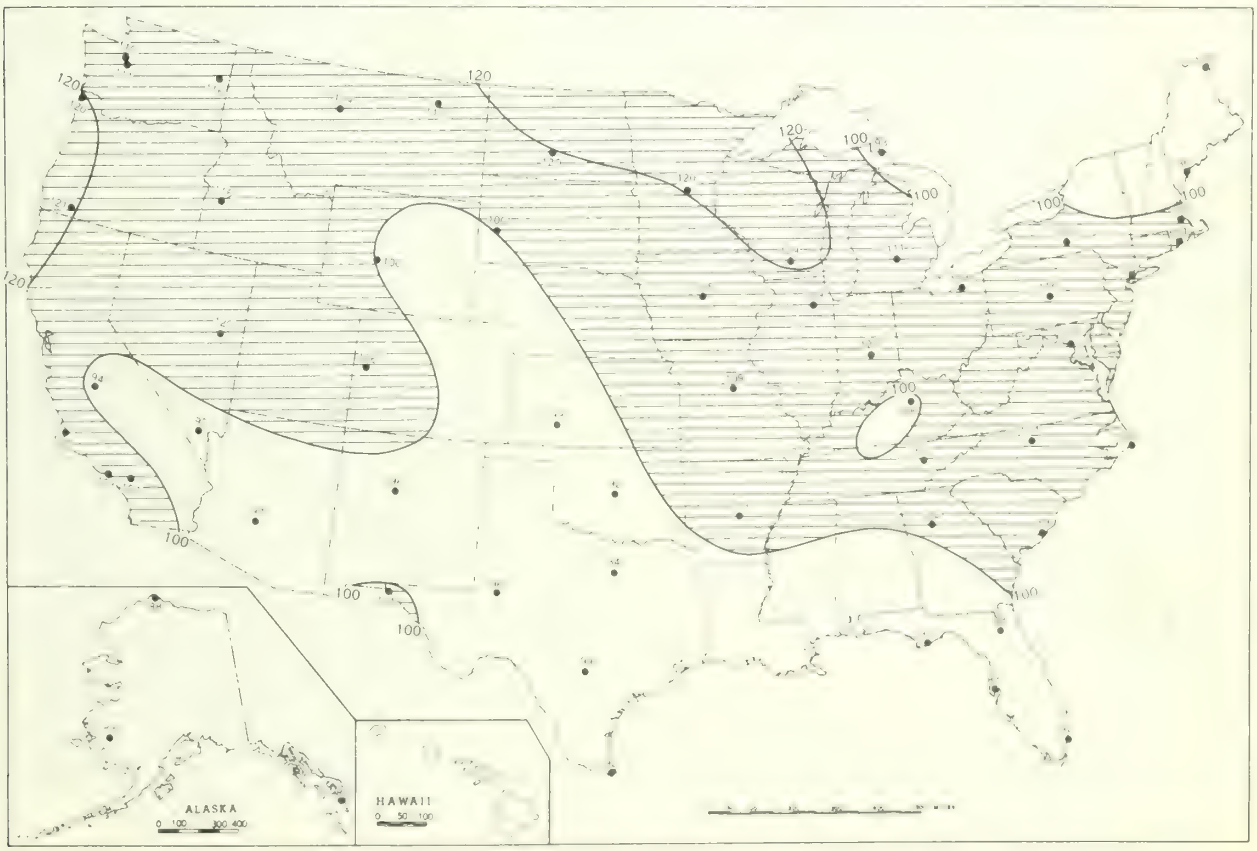


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, March 1969.

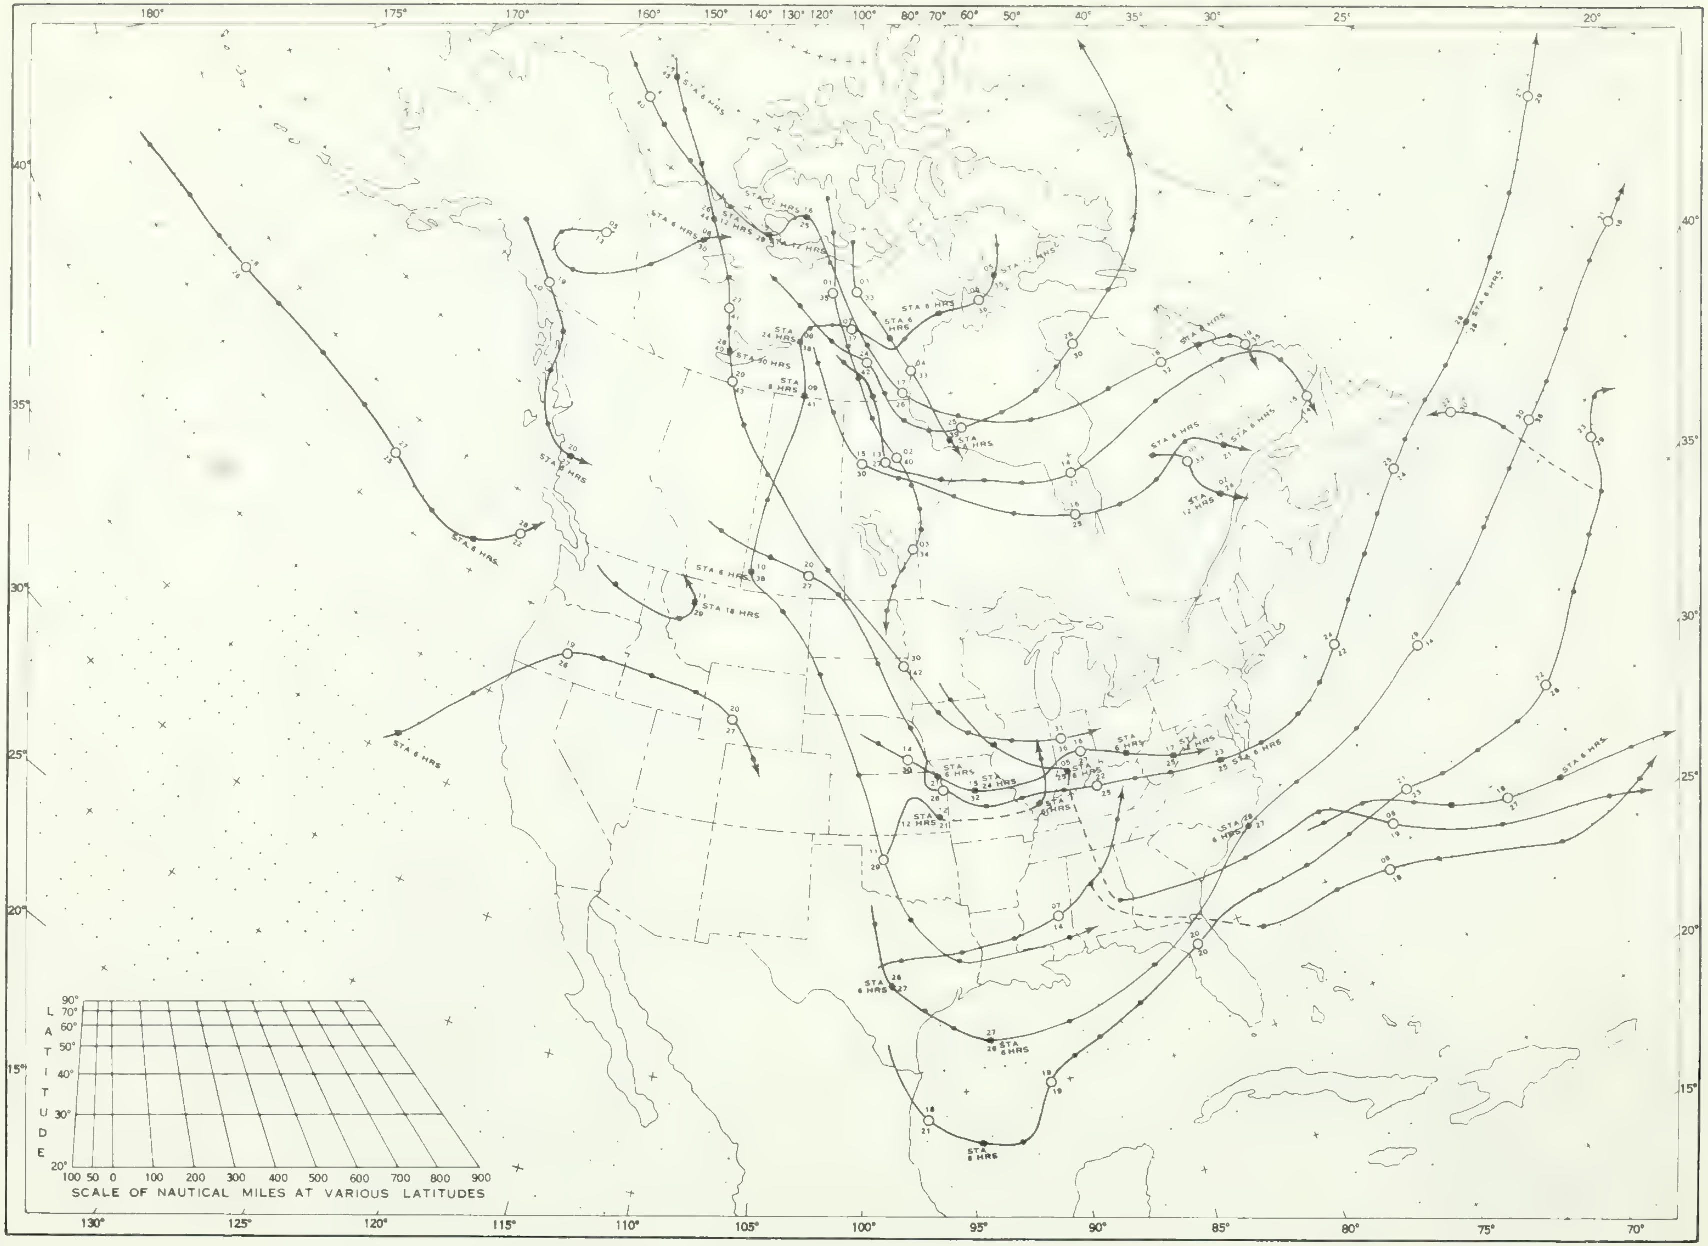


B. Percentage of Mean Daily Solar Radiation, March 1969.



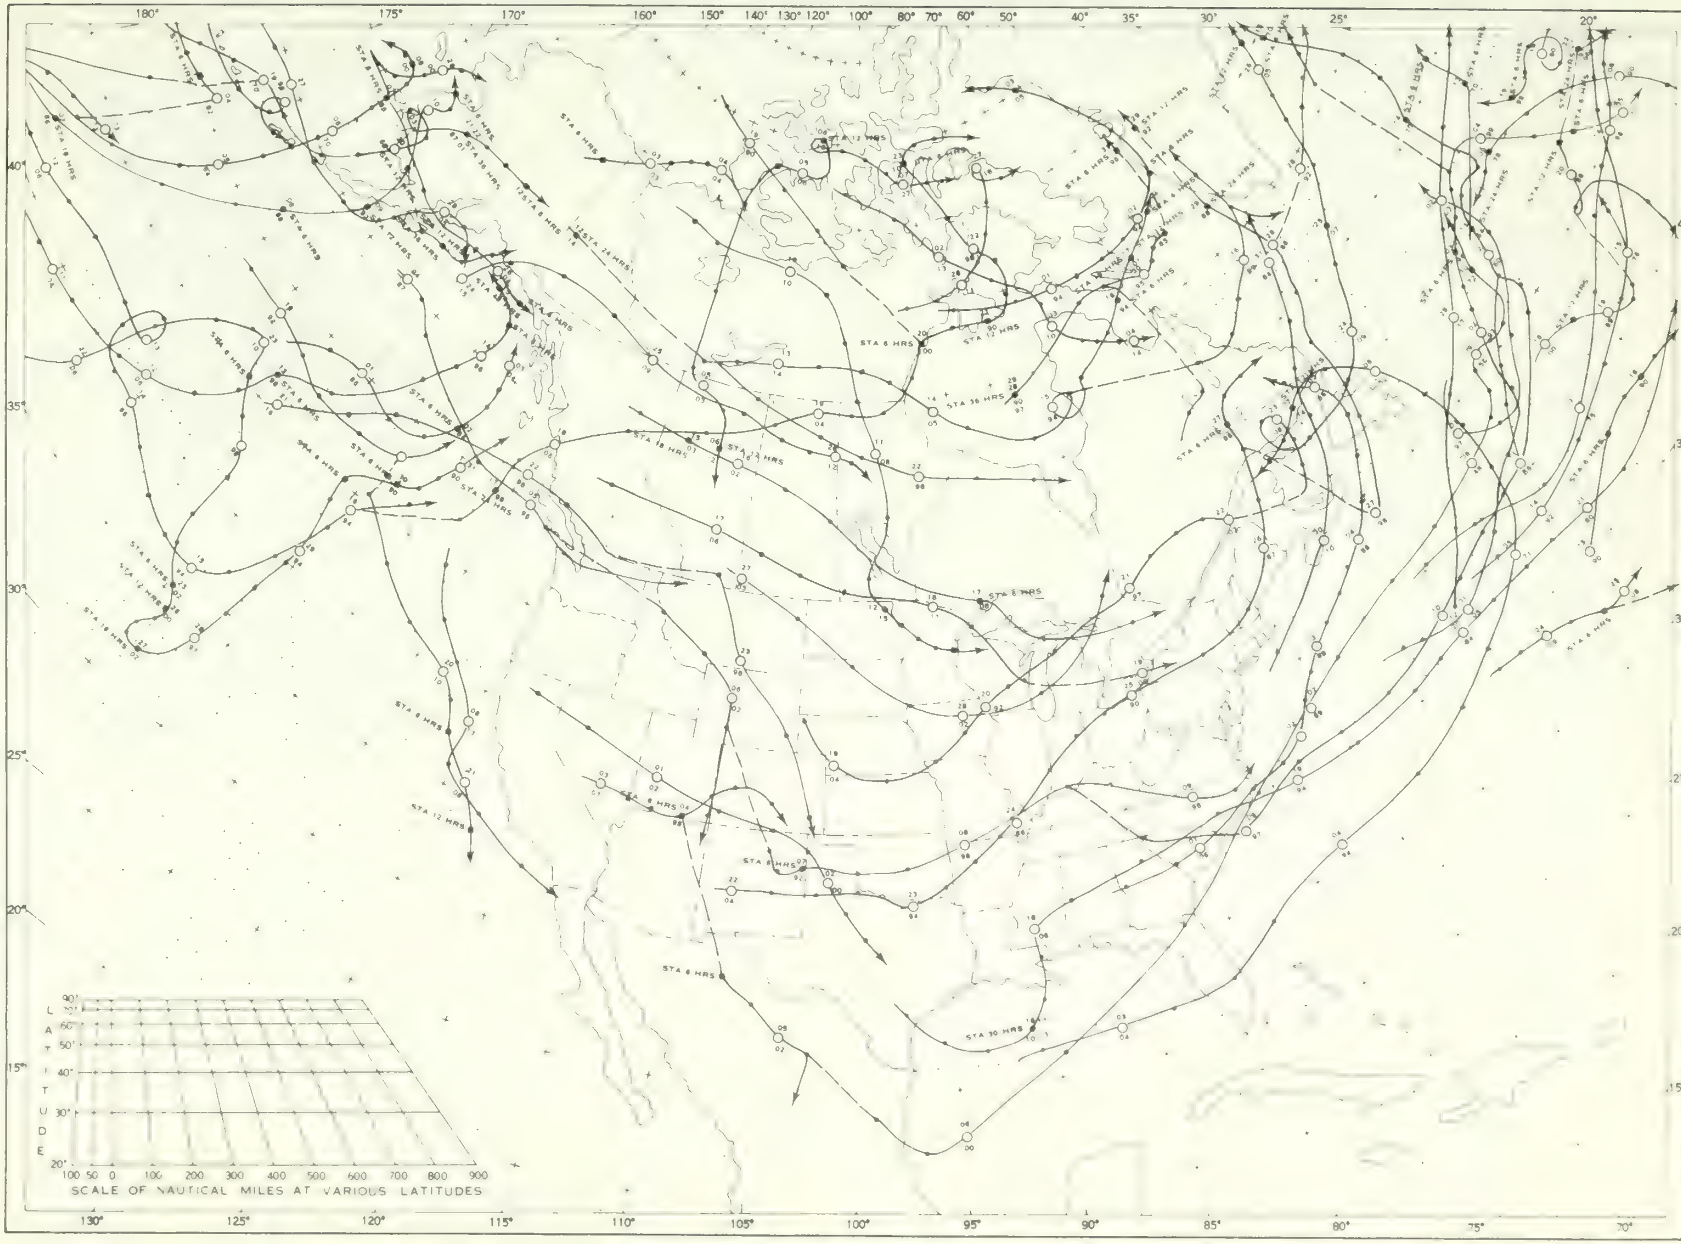
A Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, March 1969.



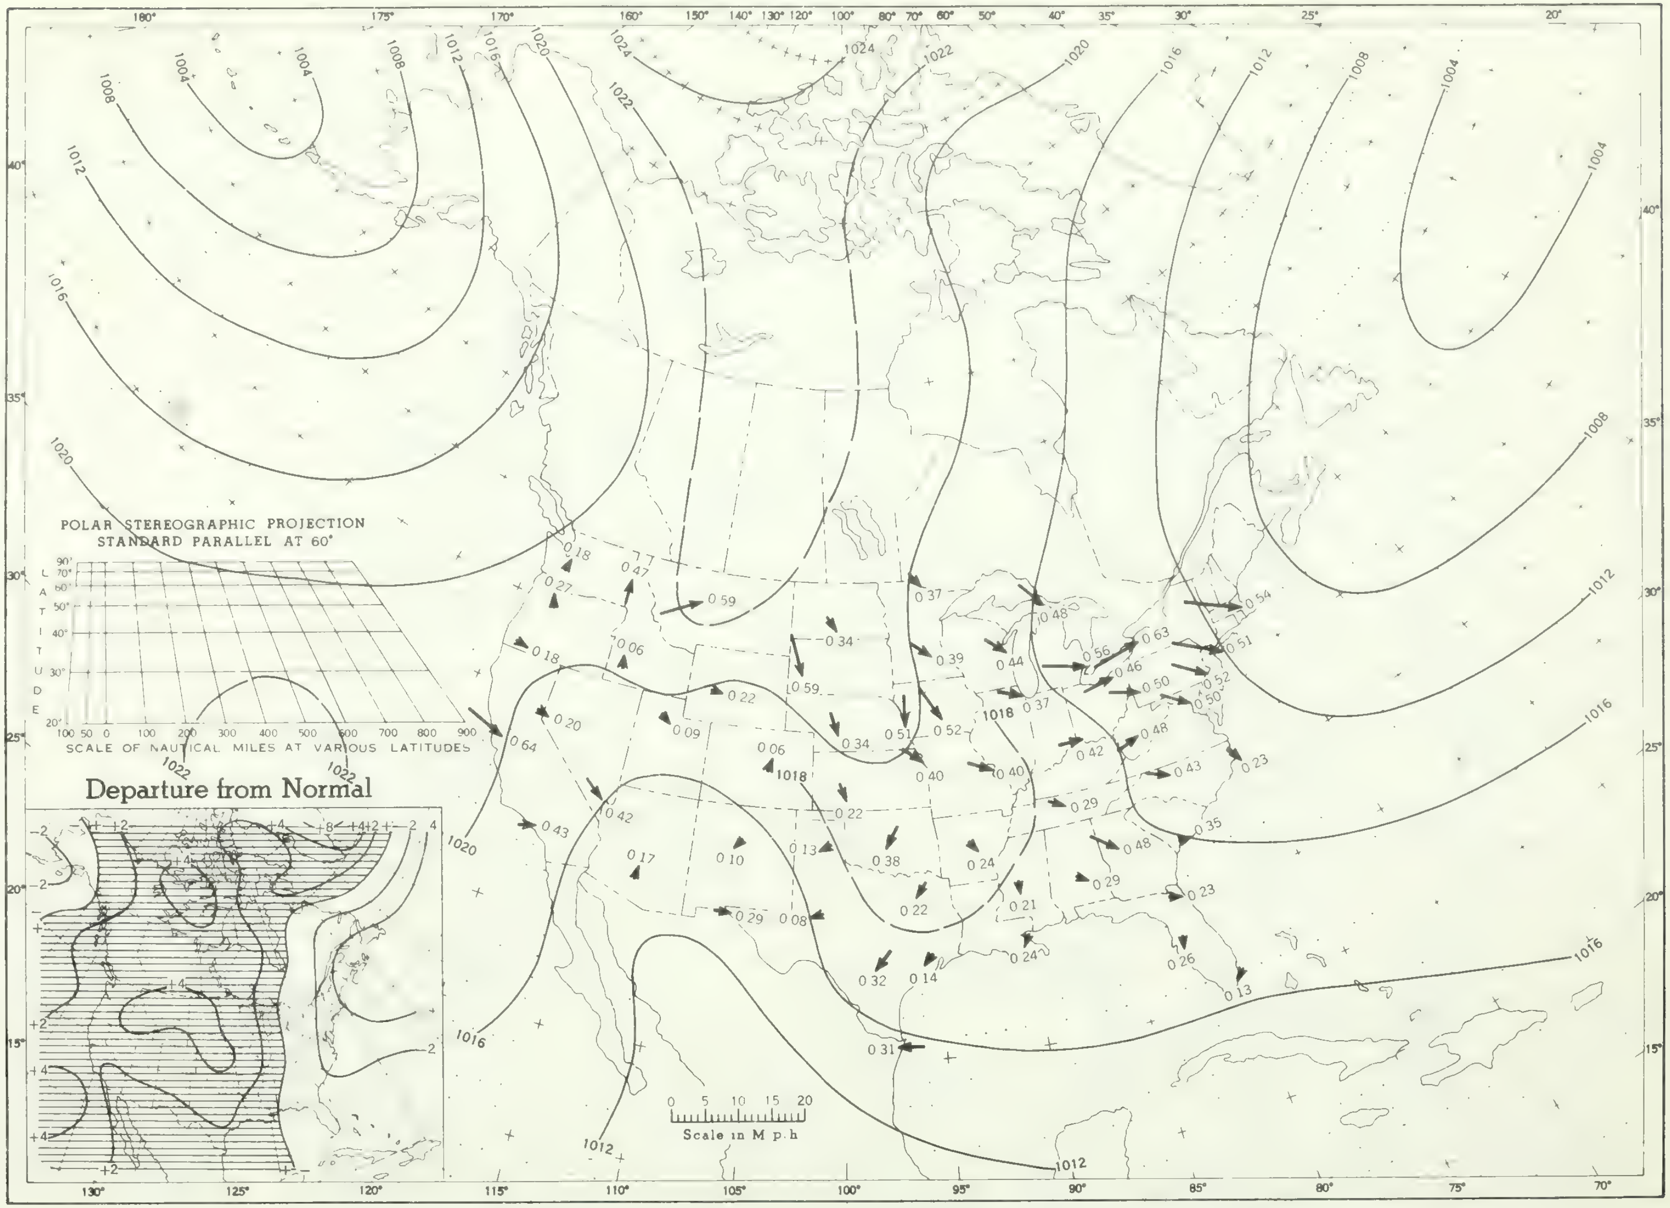
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, March 1969.



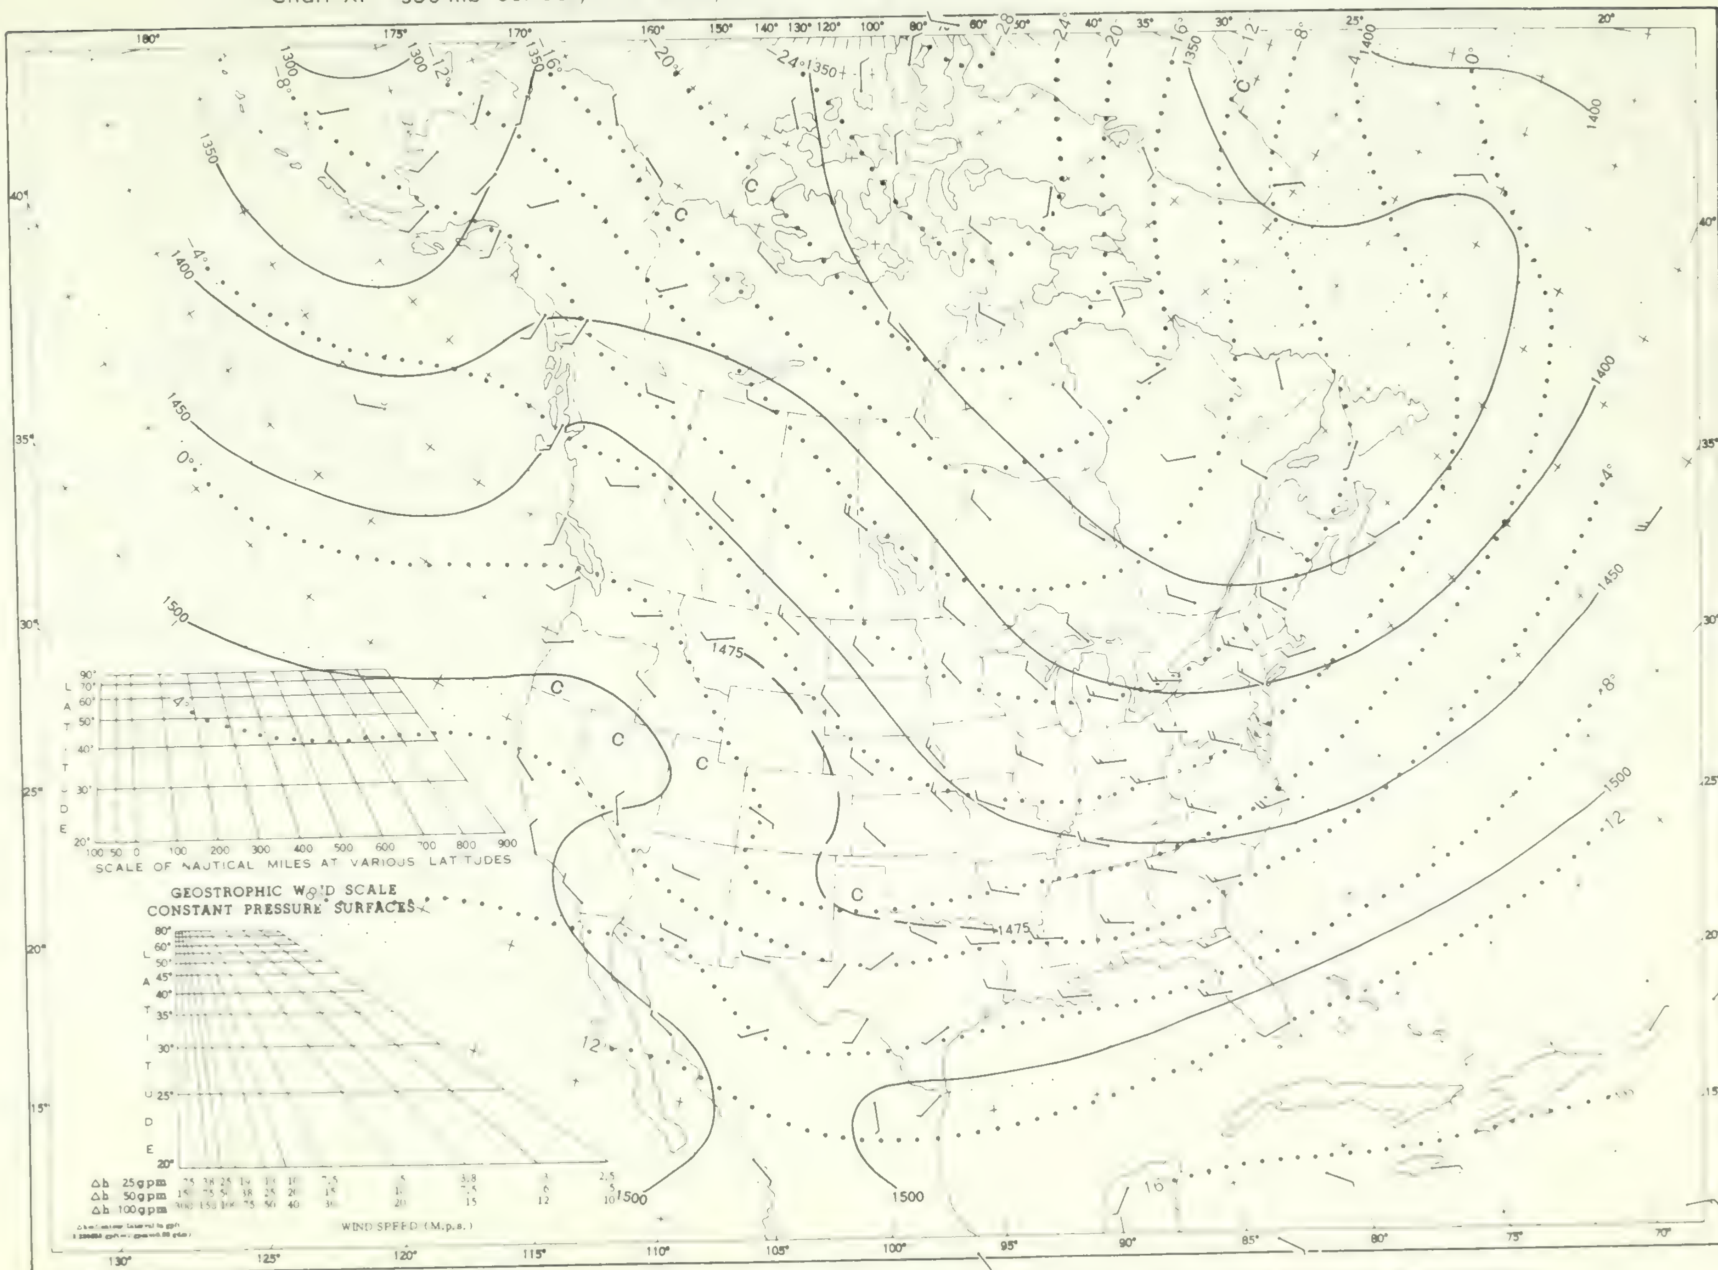
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X Average Sea Level Pressure (mb) and Resultant Surface Wind, March 1969. Inset Departure of Average Pressure (mb) from Normal, July 1969.



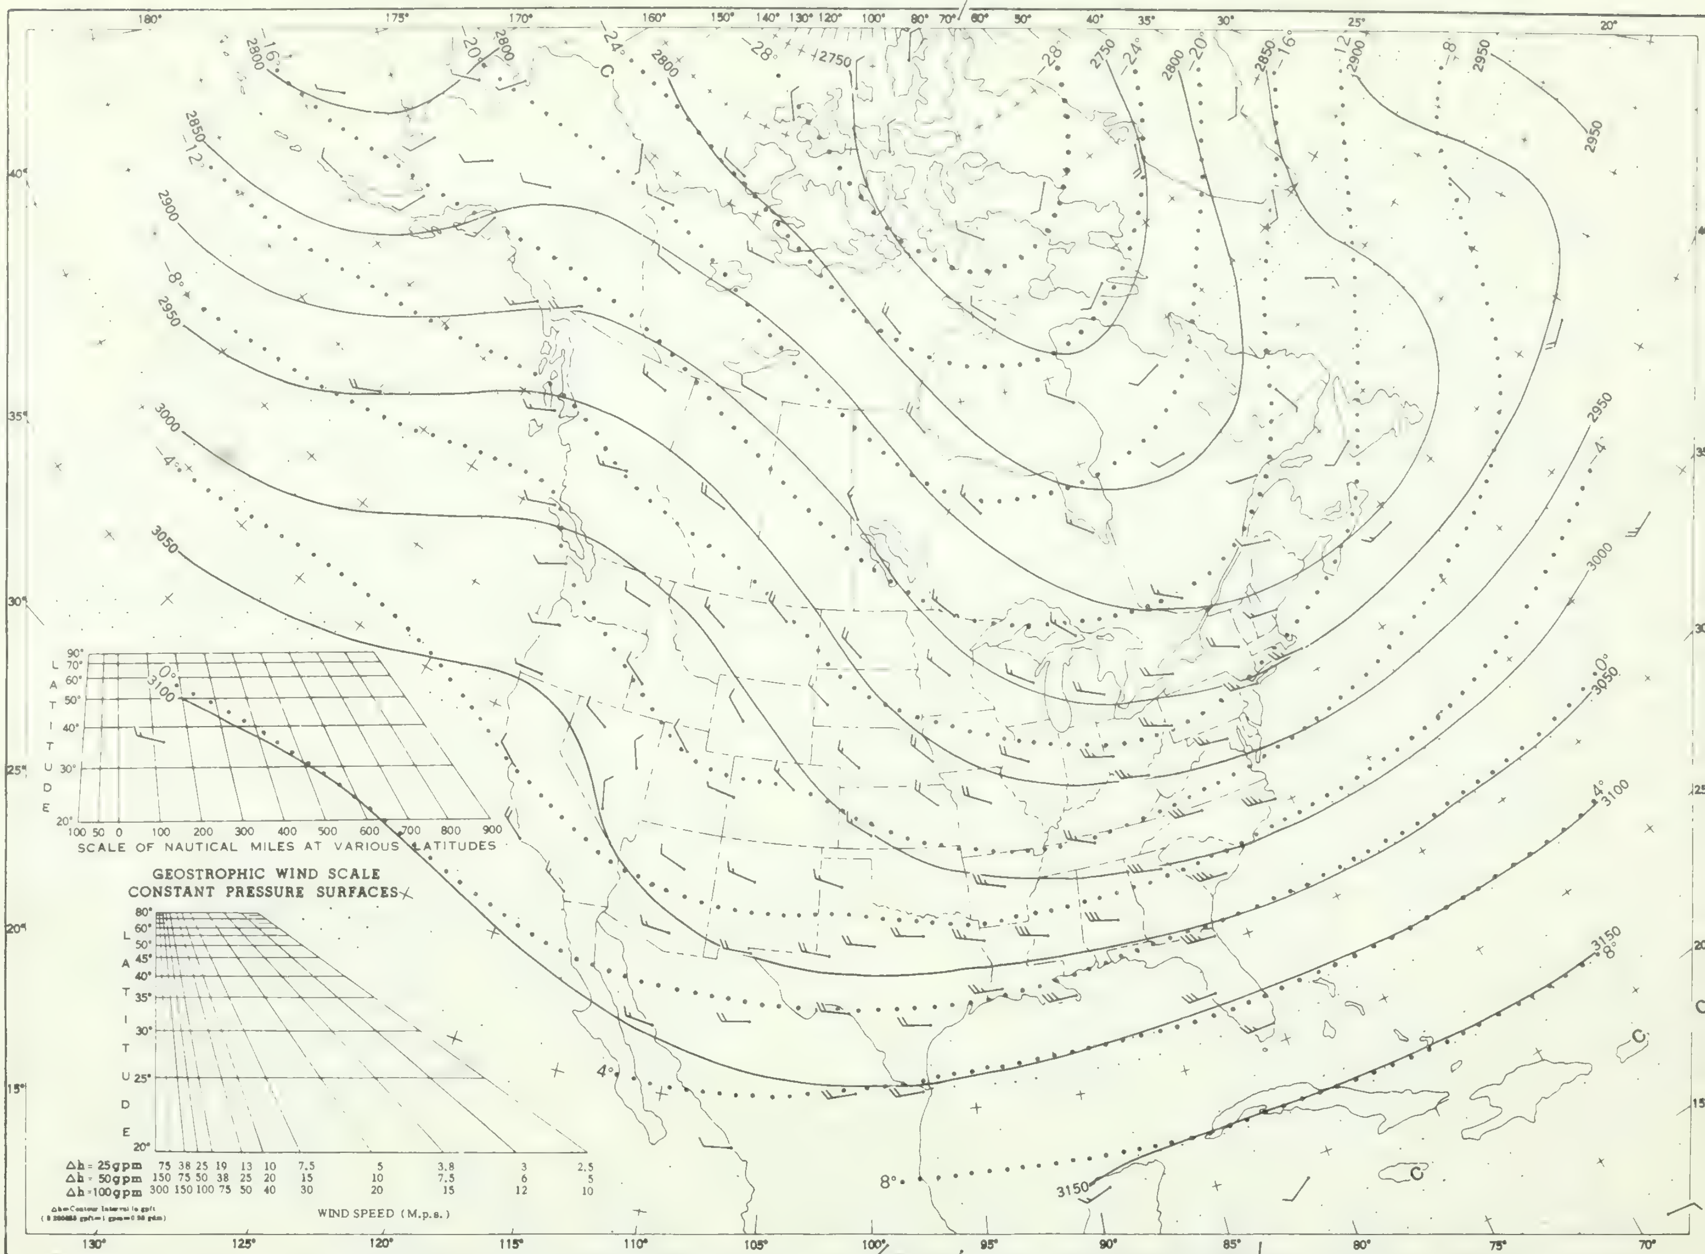
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI 850-mb Surface, 1200 GMT, March 1969. Average Height and Temperature, and Resultant Winds



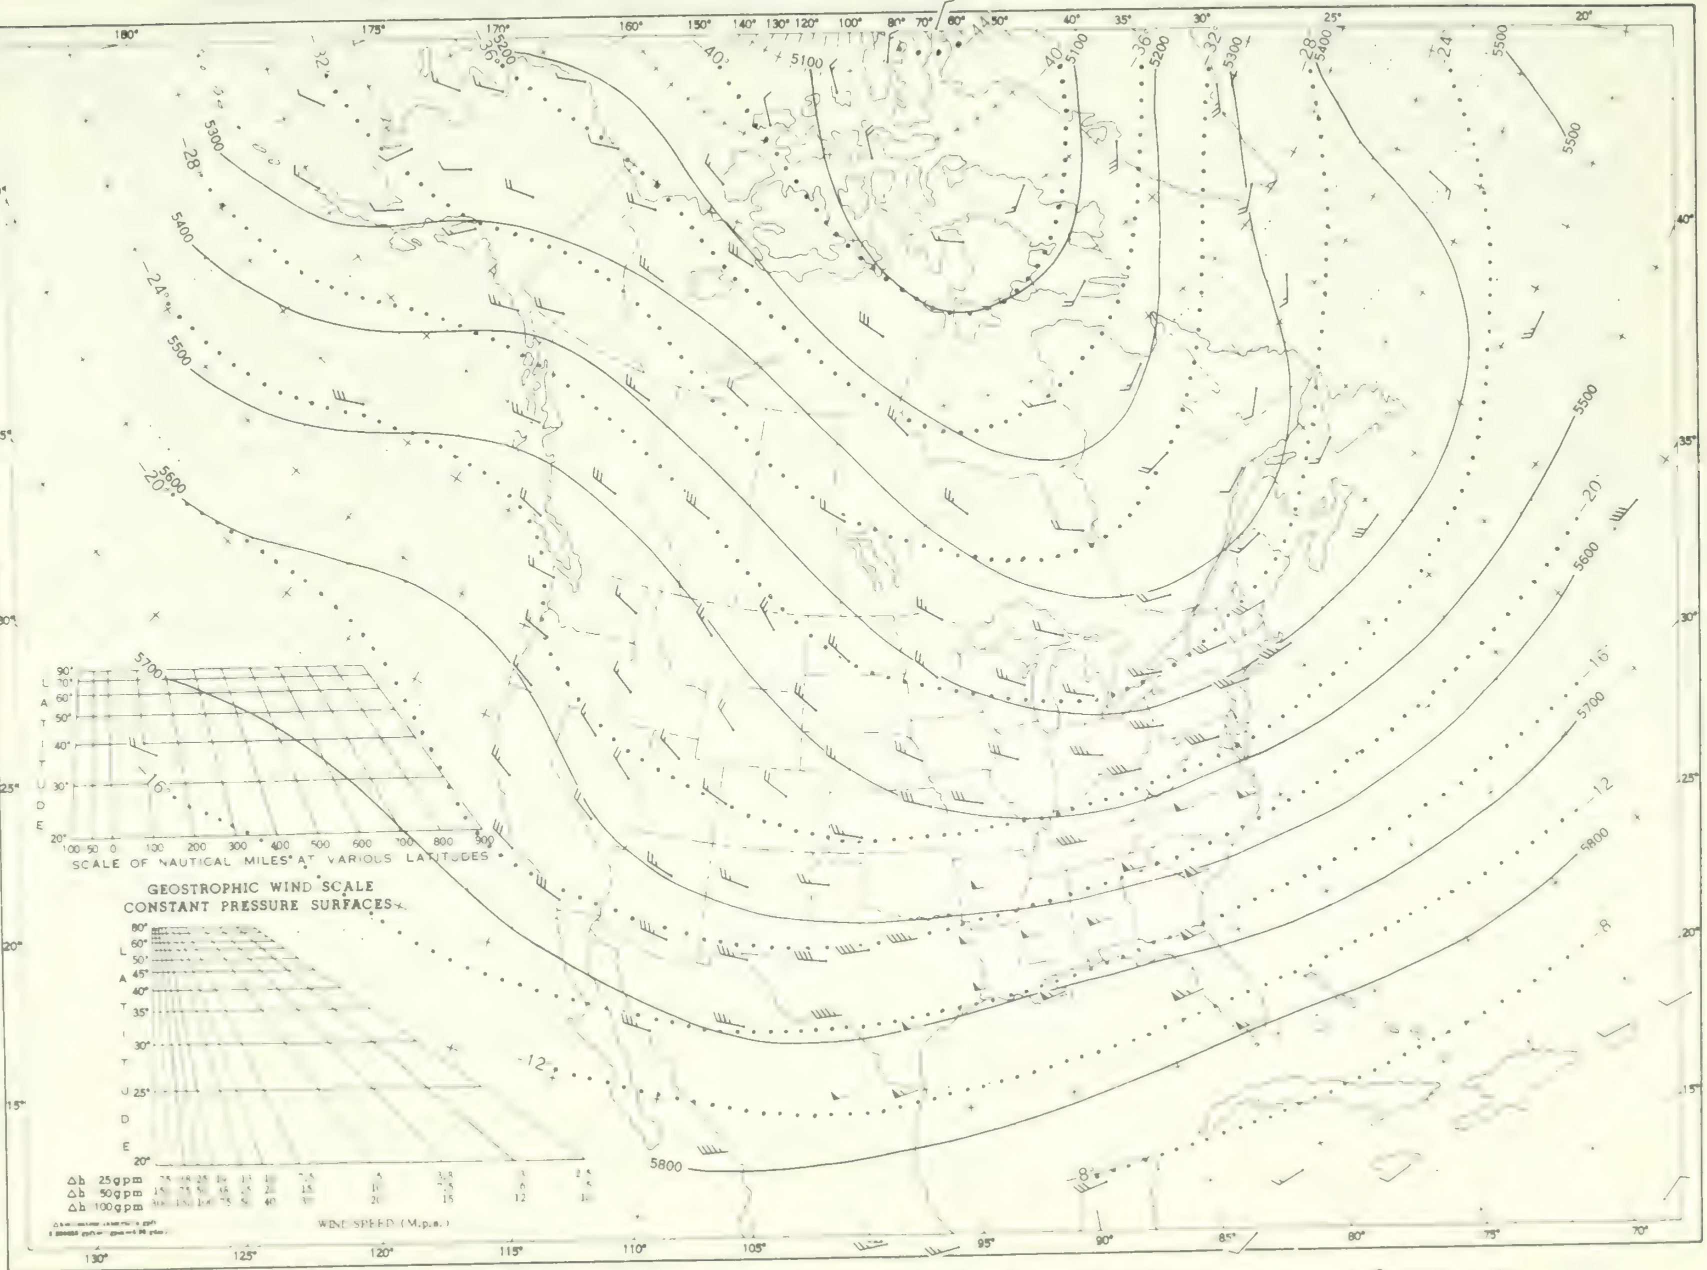
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb Surface, 1200 GMT, March 1969. Average Height and Temperature, and Resultant Winds.



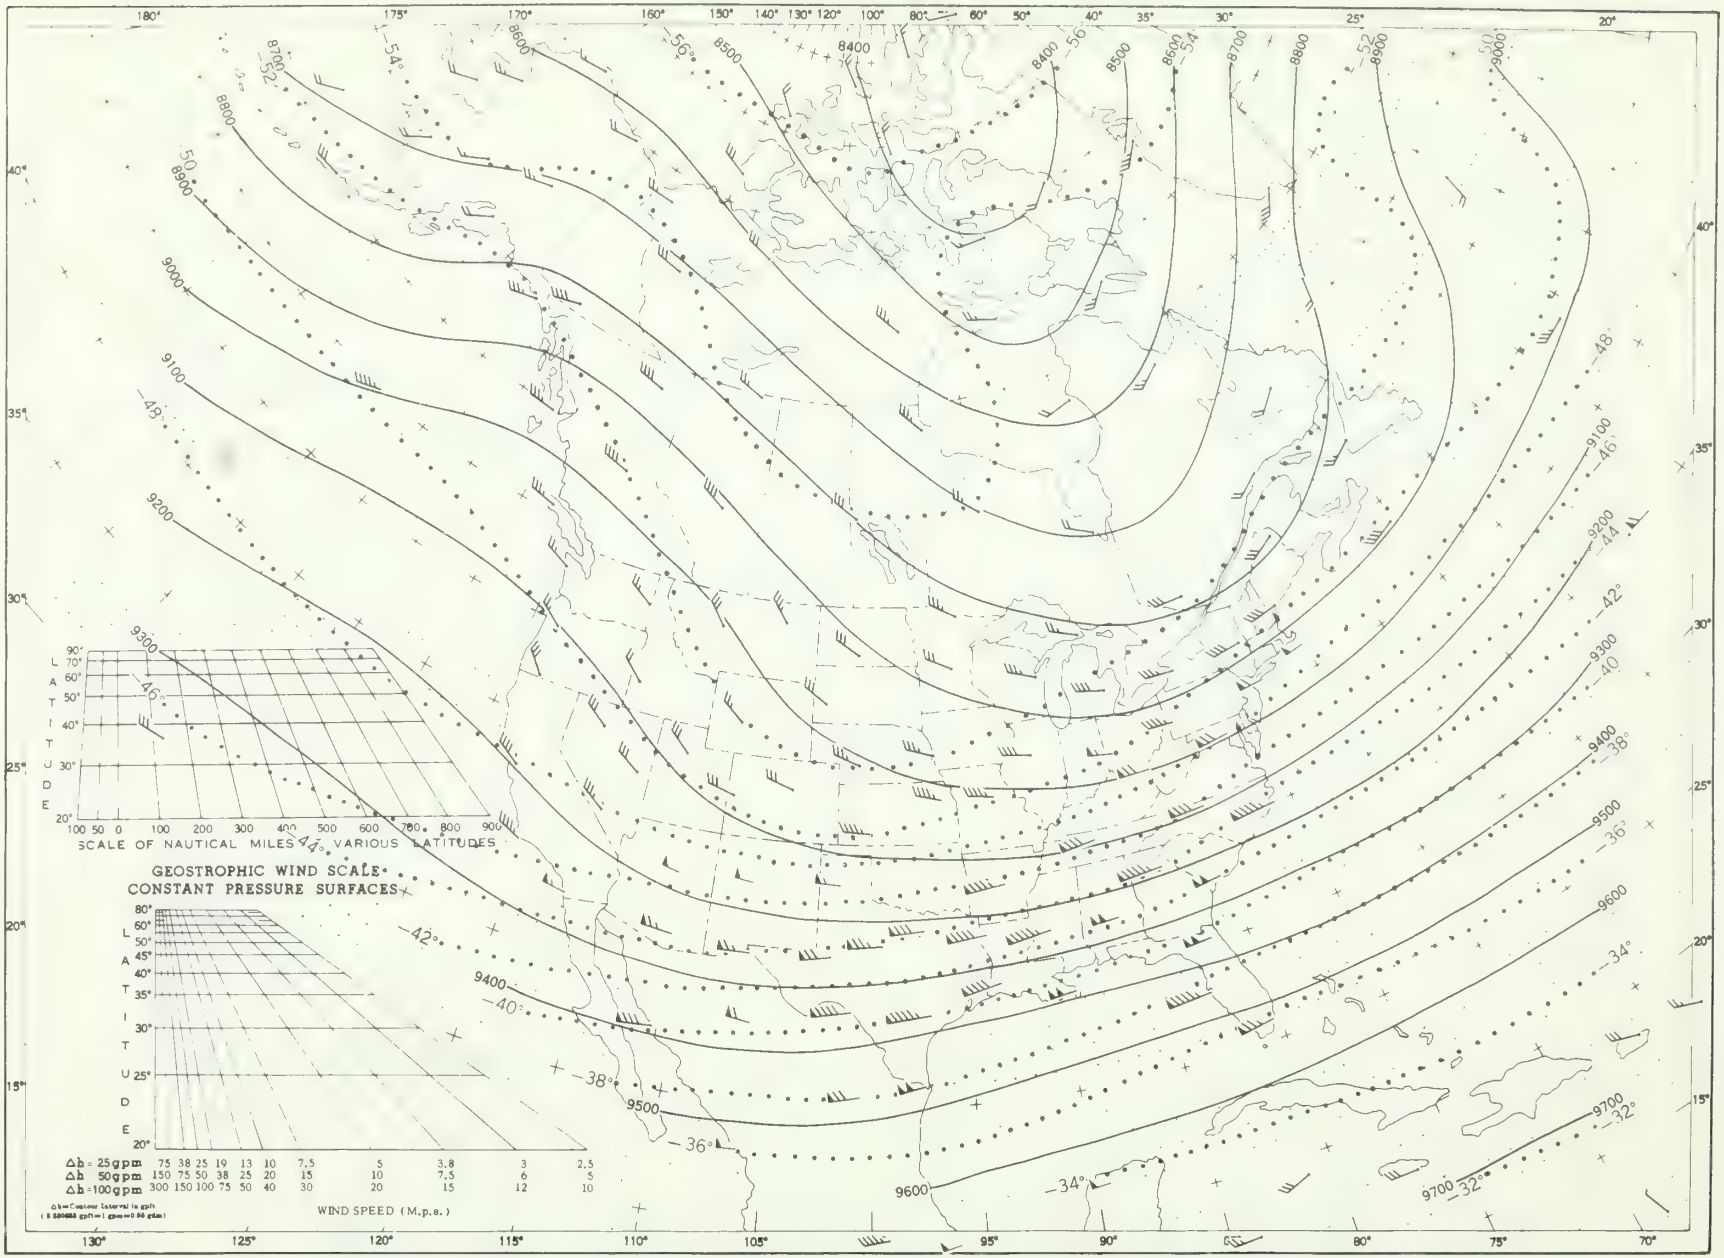
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 GMT, March 1969. Average Height and Temperature, and Resultant Winds



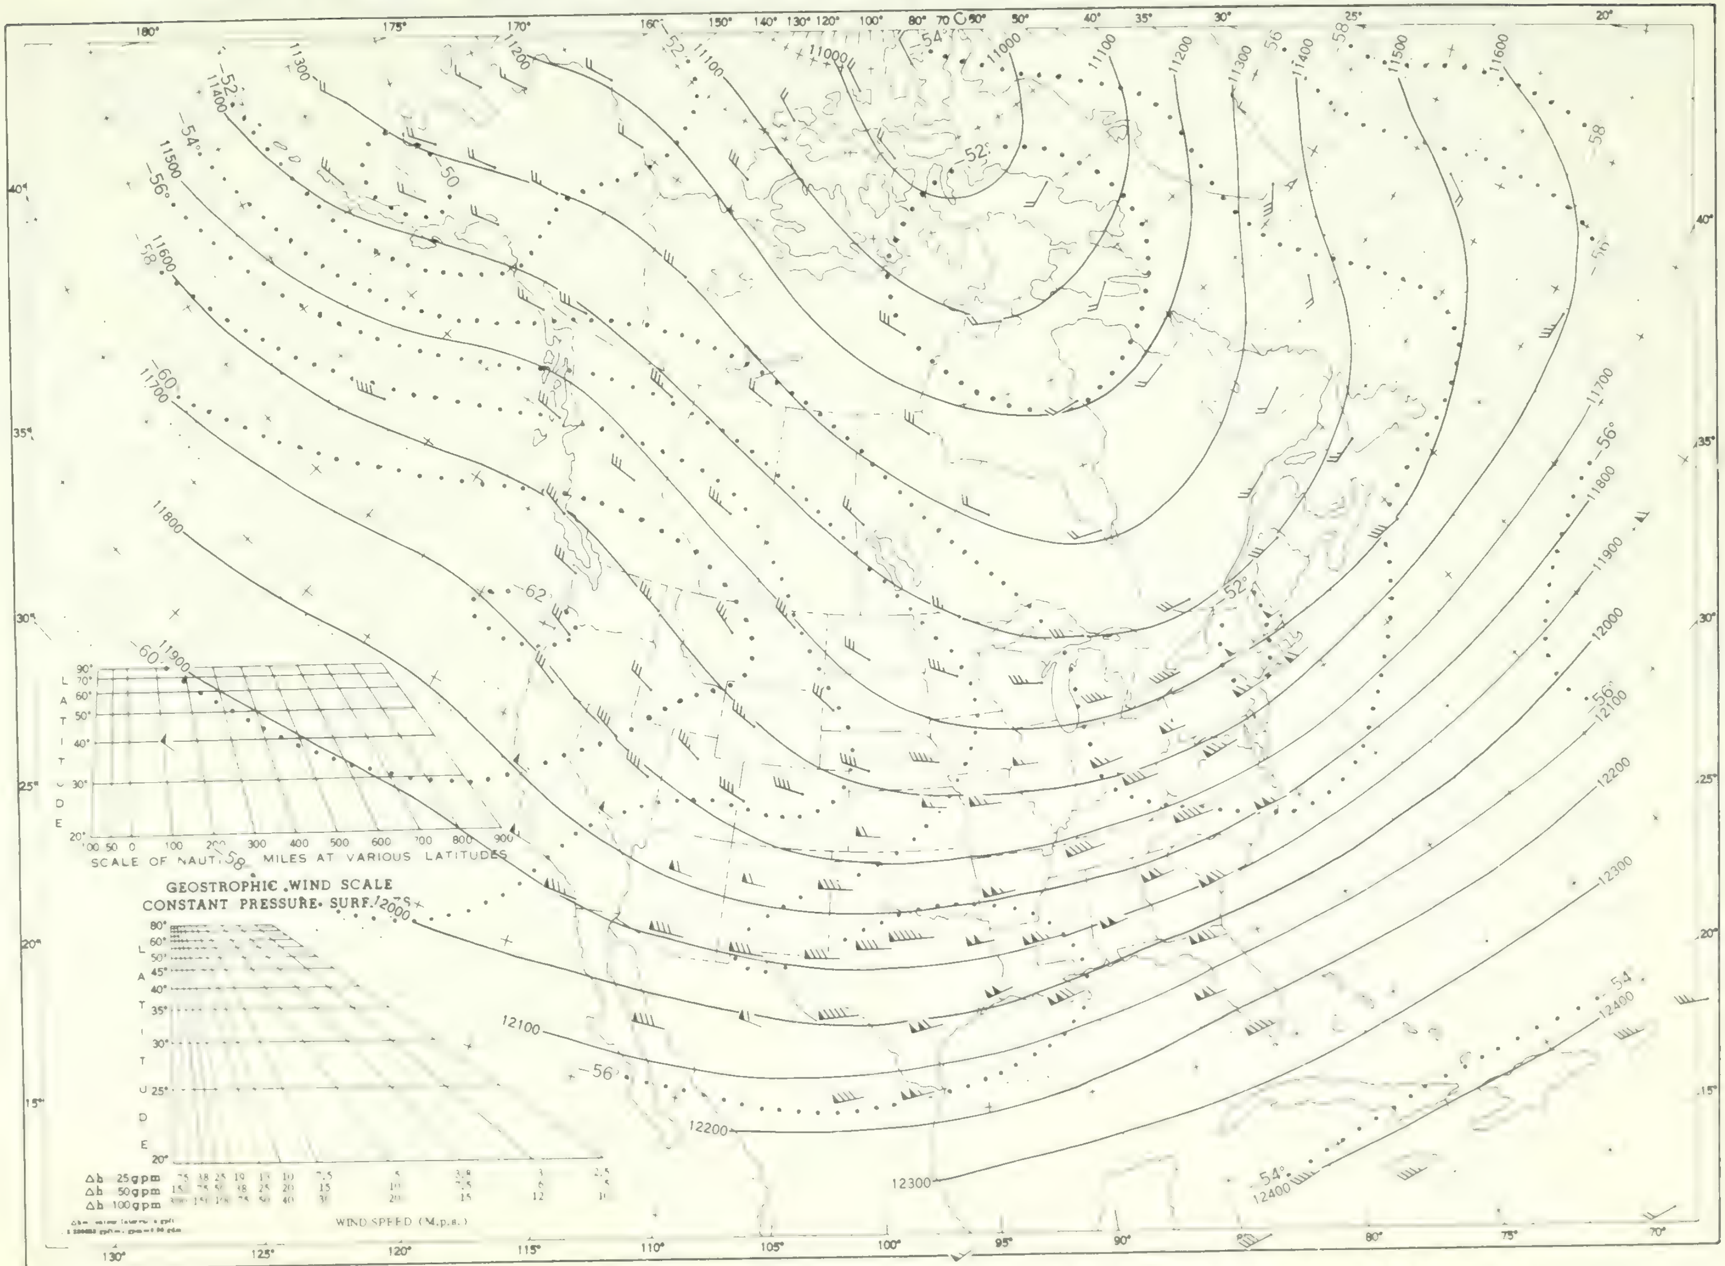
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV   300-mb. Surface, 1200 GMT, March 1969. Average Height and Temperature, and Resultant Winds



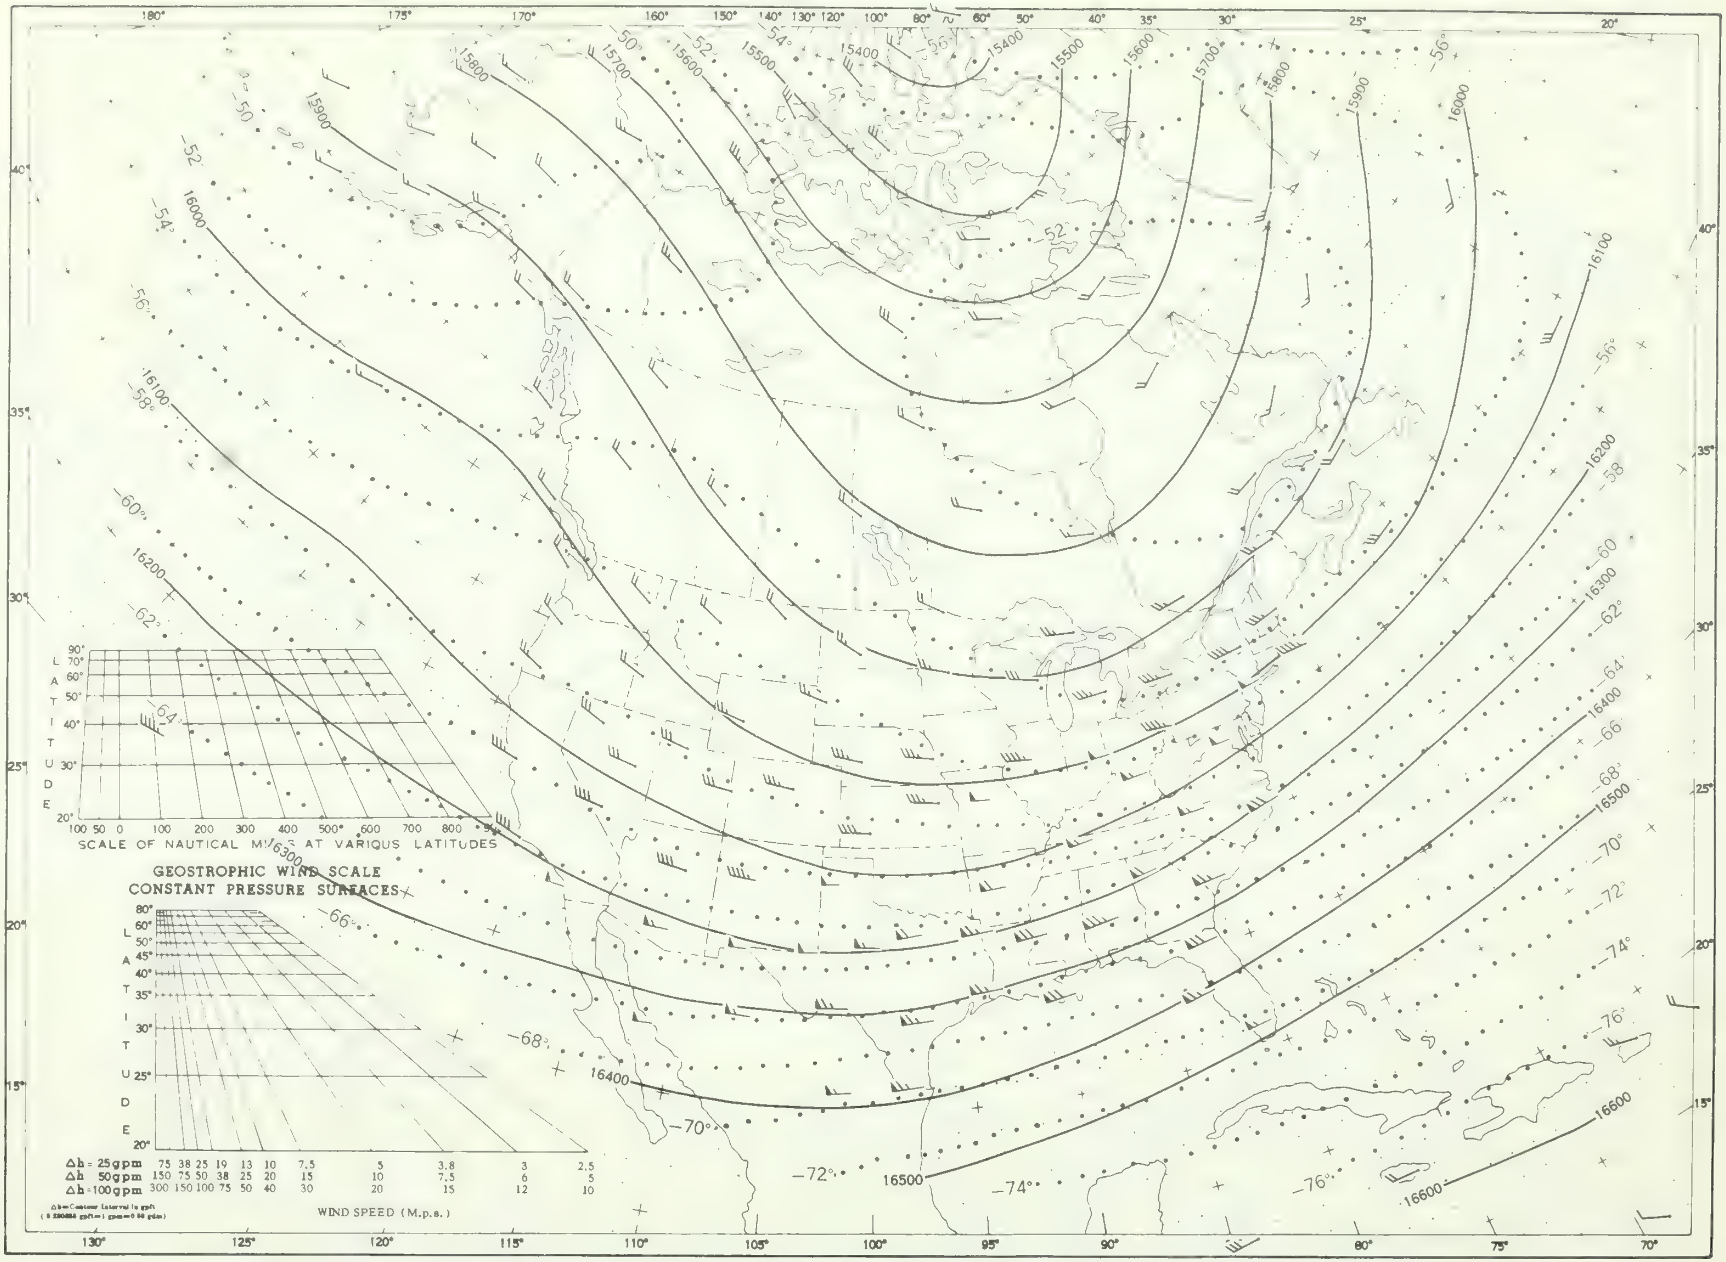
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV. 200-mb. Surface, 1200 GMT, March 1969. Average Height and Temperature, and Resultant Winds.



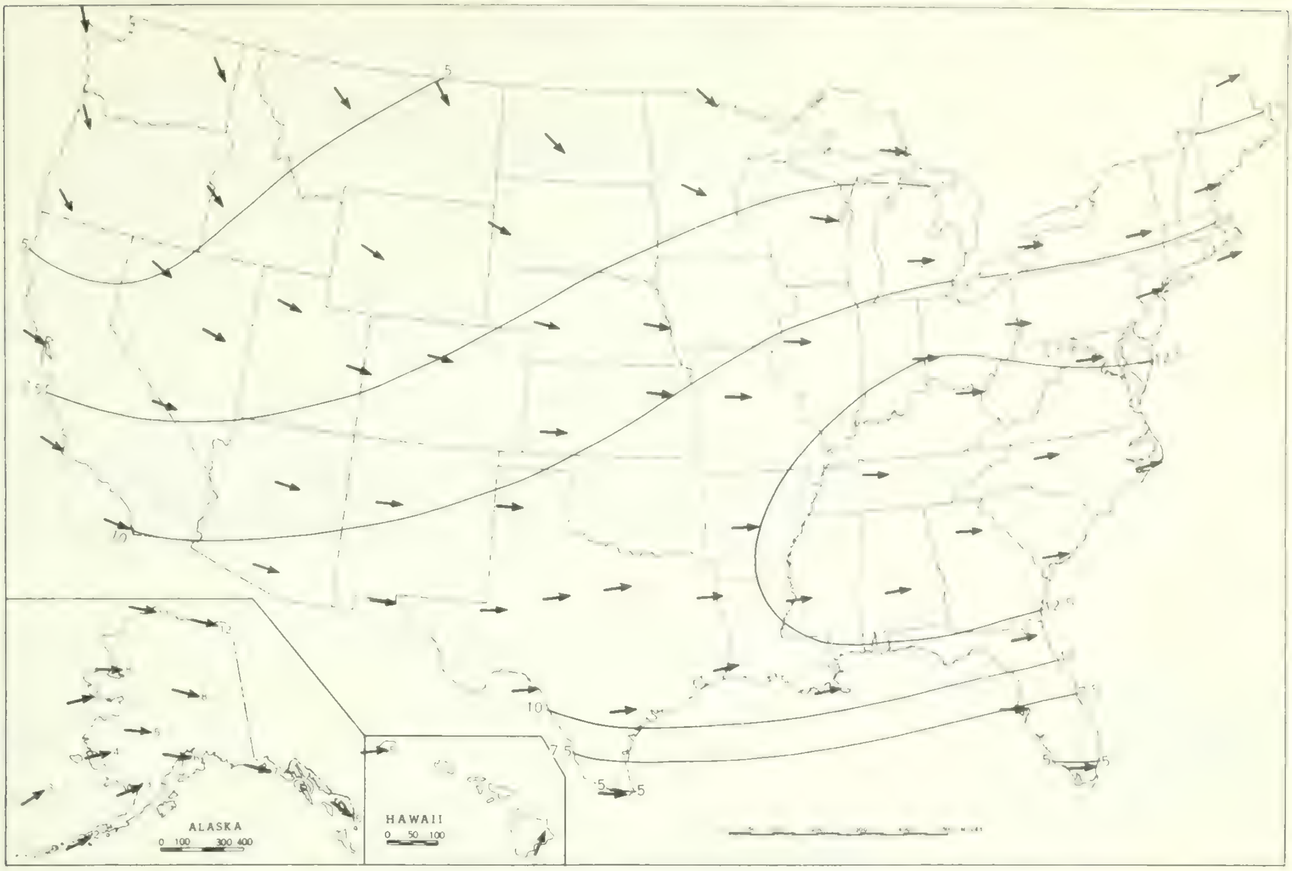
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI 100-mb. Surface, 1200 GMT, March 1969 Average Height and Temperature, and Resultant Winds.

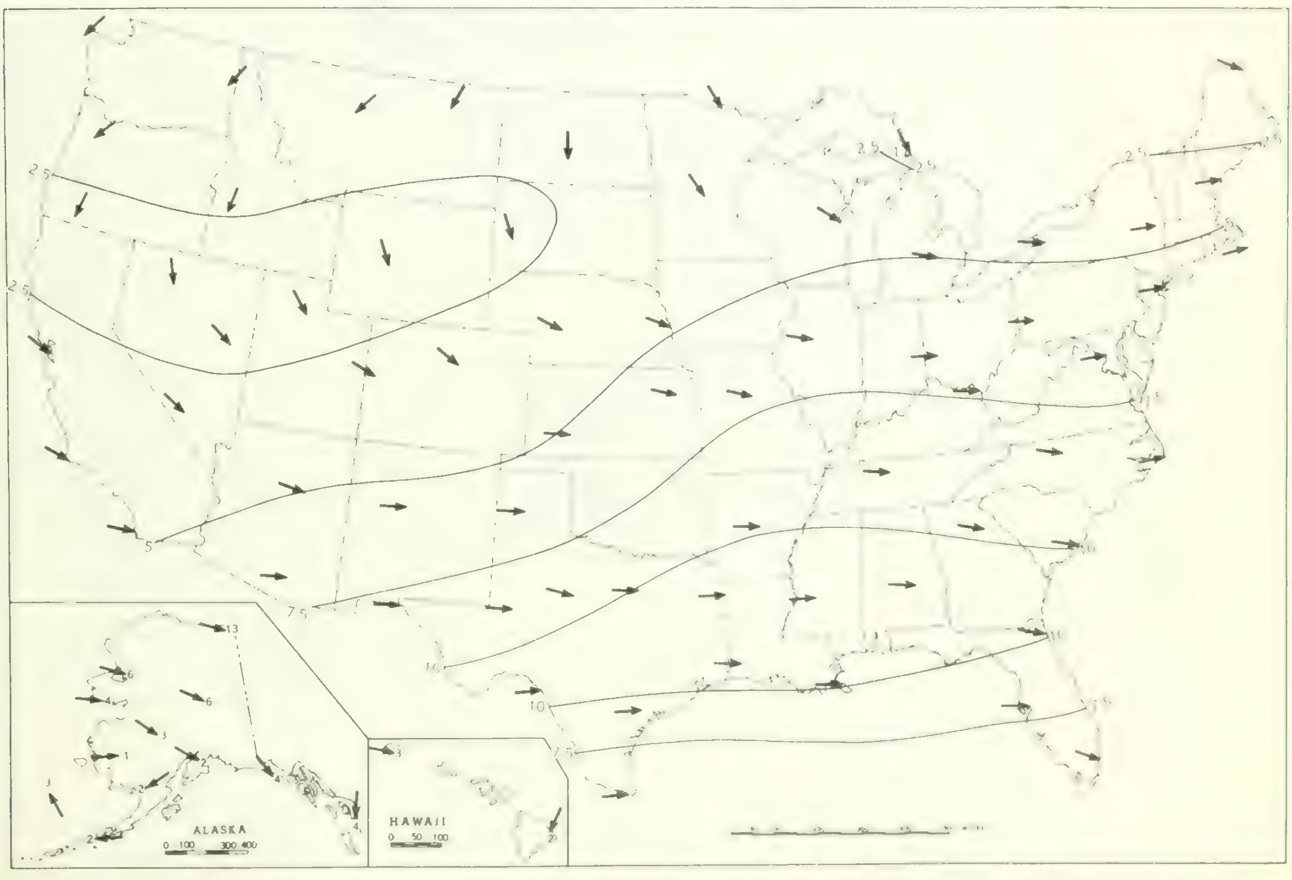


Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 GMT, March 1969. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, March 1969. Resultant Winds.



Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

NATIONAL SUMMARY

APRIL 1969
Volume 20 No. 4

Asheville 1969

CONTENTS

NOTE: Delayed data and corrections will be carried in the June and December issues of this publication. An explanatory page "Description of Charts" will be carried in the January and July issues.

SUBSCRIPTION PRICE: Monthly 20 cents and annual 40 cents per copy; yearly subscription, including monthly and annual issues, $2.50 domestic, $3.50 foreign. Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to "Superintendent of Documents, Government Printing Office, Washington, D.C. 20402"

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 20 No. 4 APRIL 1969

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:
1. Warm temperatures early in April caused rapid thawing of the deep snow cover in the north-central Great Plains, producing record flooding.
2. Damaging hailstorms, windstorms, and tornadoes hit the central States and the Deep South.
3. Temperatures averaged above normal in April, following one of the coldest Marches of record.

TEMPERATURE.--Most of the Nation averaged warmer than normal in April. The northern edge of the Country from the Continental Divide to Lake Superior, the eastern slopes of the northern and central Rocky Mountains, and the western edge of the northern and central Great Plains averaged several degrees warmer than normal. Warmer-than-normal temperatures prevailed over almost the entire Nation in the first 2 weeks of April. The West and the southern Great Plains cooled in the third week and much of the East cooled in the last week.

Widespread sunshine brought the warmest weather of the season to much of the Nation early in April. Most of the area from the Rocky Mountains to the Appalachians averaged 12° or more warmer in the first week of April than in the last week of March. Parts of the central Great Plains averaged 16° to 23° warmer. The warm temperatues melted much of the snow in the northern Great Plains, causing increased streamflow and flooding of low-lying areas. The warming trend continued in the 2d week of April. Afternoon temperatures climbed to the 80's over the southern Great Plains and to the 60's and 70's in the northern and central Great Plains by April 13.

The warming trend was interrupted in the 3d week of April as Canadian air cooled the West and the North Central States, tumbling temperatures sharply. Moist Gulf air continued to warm the East but the warmest spots were in the Southwestern Deserts where maximums reached the 90's on 2 or 3 days. As the slow-moving cold front advanced across the central part of the Nation, minimums dropped to below freezing. North Platte, Nebr., registered 21° on the morning of the 18th. Cooler weather reached the Northeast late in the 3d week of the month.

Chilly weather with subfreezing minimums prevailed over the North in the last week of April while mild temperatures, blue skies, and generally pleasant weather prevailed over the South.

PRECIPITATION.--Widespread sunshine prevailed over most of the Nation at the beginning of the month, with a few showers along the northern Pacific coast and in the northern Rocky Mountains, light snow flurries from the northern Great Lakes to the Appalachians, and light snow or freezing drizzle in the Upper Mississippi River Valley. About the middle of the first week, a few showers and thunderstorms broke out along a front that stretched from Arkansas to New England. Shower activity increased over the central Great Plains, and late in the week drizzle and fog covered the northern Great Plains to the Canadian border. Moderate to heavy showers hit parts of the Central and South, and Missouri had its first tornadoes of the season.

Heavy rains early in the second week of April combined with the snowmelt to send the tributaries of the middle Missouri and upper Mississippi Rivers to near or above previous record stages. Torrential downpours fell from southeastern Kansas to southern Illinois, and hail and violent windstorms swept across the central States on the afternoon and evening of the 9th. Hail as large as baseballs fell in Searcy County, Ark., and winds at Hot Springs gusted to 70 m.p.h. Violent thundersotrms dumped heavy rain in northern Mississippi. Creeks overflowed, flooding numerous roads and some residential areas and washing away bridges. Hail occurred with some of the storms. Downpours of 5 to 8 inches sent many south-central and southeastern Texas streams out of the banks. Numerous hailstorms and a few tornadoes struck Texas in the second week of April. The tornadoes caused only a few injuries but some resulted in extensive property damage, especially in Matagorda County on the 11th.

Snow fell in the central Rocky Mountains early in the third week of April--8 inches at Rawlins, Wyo. Severe thunderstorms became active in the moist Gulf air that covered the central and southern Great Plains. Hail as large as baseballs pelted Comanche, Okla., on the 16th. A man south of Comanche was seriously injured when a tornado struck his home. Numerous other tornadoes and hailstorms hit Oklahoma and neighboring States on the 16th. More than a dozen tornadoes touched down from Alabama to the Carolinas on the 18th. One of the worst of these struck at least 9 areas as it skipped from the southwest corner of Georgia to the Atlantic coast. Miraculously, no one was killed but about 30 persons were injured and property damage, mostly to buildings, powerlines, and timber, was estimated at about $2 million.

Snow fell from Ohio to New England on the 19th, accumulating to 6 inches in northern New York.

A storm centered in the western Great Lakes region April 21 moved eastward to the Atlantic coast. It produced squally weather over the Great Lakes and blustery, cool, wet weather to much of the northeast quarter of the Nation. Damaging winds occurred from Iowa to Ohio; snow and sleet fell in Upper Michigan; and heavy rains drenched the Northeast from Maine to Weat Virginia. The rains flooded roads, especially underpasses, basements, and cellars, and forced the families living in some lowlands to leave their homes temporarily. Reports of flooding came from Maine, New Hampshire, Vermont, Massachusetts, New York, and Ohio. Rapid late-season snowmelt contributed to the flooding in the eastern Adirondacks of New York. Hail, lightning, and wind damage occurred in some areas in connection with this storm.

A storm which moved into the Far Northwest near the end of the third week of April dumped 5 inches of snow at Blue Canyon, Calif. Thundershowers occurred in the Rocky Mountains. Hail up to 1 1/4 inches in diameter fell at Denver, Colo., on the 22d. This storm, a few days later, brought moderate to heavy snow in the northern Rockies and the adjacent Great Plains. A foot or so of snow fell in some localities in Wyoming, and Duluth, Minn., received 9 inches. A number of tornadoes struck parts of the South late in April.

One of these struck a mobile home park in Collin County, Texas, completely destroying 30 of the homes and sending 42 persons to hospitals. The month ended with a new storm developing in the northern Rocky Mountains, accompanied by rain, snow, and strong winds. Moist Gulf air moved northward. Thunderstorms occurred from Kansas to Texas and a thunderstorm dumped 5 inches of rain on Corpus Christi, Texas, in the afternoon of April 30.

FLOODS.--Alltime record flooding occurred along the Big Sioux and James Rivers and their tributaries in April. Continued cold temperatures in March prevented thawing of the deep snow accumulations from the heavy winter snow--94.7 inches at Sioux Falls, S. Dak. The water content of the snowpack in southeastern South Dakota ranged from 5 to 10 inches. The warming temperature trend in April caused record flooding along the Big Sioux and James Rivers and their tributaries and lesser flooding in the Vermillion River Basin. Overall flood damages were estimated at $19 million, mostly to roads and bridges. It was impossible to determine the amount of damage to agricultural lands. Serious flooding occurred along the Souris River driving 4,000 persons from their homes in the Minot, N. Dak., vicinity. Massive flooding occurred at Fargo, N. Dak., along the Red River of the North and its tributaries. Flooding occurred in Iowa and Minnesota along the tributaries of the Missouri and upper Mississippi Rivers. Heavy rains caused flooding along some streams in the Deep South, especially in Louisiana, Mississippi, Georgia, and South Carolina.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed 'Greatest in 24 hours' are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column 'Fastest Mile' is the highest observed 1 minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which 'Fastest Mile' data can be evaluated.

B Number of days maximum 21.1 C. or above for Alaskan Stations.
Y Peak Gust
\+ And also on an earlier date or dates.
∅ Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

HEATING DEGREE DAYS

(Base 65°F.)

APRIL 1969

C Crop damage
S Several

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
\# Freezing drizzle and freezing rain, commonly known as glaze.
∅ For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, ESSA, monthly publication <u>STORM DATA</u>.

† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000
7 $5,000,000 to $50,000,000
8 $50,000,000 to $500,000,000
9 $500,000,000 to $5,000,000,000

SNOWMELT FLOODS IN THE RED RIVER OF THE NORTH, UPPER MISSISSIPPI, AND MISSOURI BASINS

MARCH-MAY 1969

Elmer R. Nelson, Office of Hydrology

INTRODUCTION

The snowmelt floods of 1969 in the Red River of the North, Upper Mississippi and Missouri Basins caused an estimated property damage of $175 million and 8 deaths. Accurate and timely flood forecasting by ESSA Weather Bureau permitted early and reliable warnings, and the response through Operation Foresight prevented some $250 million in damages. This does not include $86 million of potential damage avoided by storage of flood waters in federal reservoirs in the Upper Missouri Basin.

In the Red River of the North Basin, the spring flood of 1969 was the most severe since 1897 along the main stem from the headwaters to Grand Forks, N. Dak. Below Grand Forks, N. Dak., the flood crests were slightly lower than in April 1966. Record stages were reached on the Red Lake River at Crookston, Minn., and on the Sheyenne River at West Fargo, N. Dak., around the middle of April. In the latter half of April the Souris River at Minot, N. Dak., reached its highest stage since 1904.

In the Upper Mississippi Basin, record to near-record flooding occurred on tributary streams in southern Minnesota and northern Iowa and along the main stem of the Mississippi from the headwaters to Davenport, Iowa. In the reach from St. Paul, Minn., to Winona, Minn., and at scattered points to Davenport, Iowa, the flood of 1969 was exceeded only by the record flood of 1965.

In the Missouri Basin, record flooding occurred on some tributary streams in eastern Montana, the Dakotas, Nebraska, and Iowa. Flooding along the main stem of the Missouri River was confined to the 562-mile reach between Nebraska City, Nebr., and the junction with the Mississippi.

Flood and crest stages, periods of flooding, and other pertinent information for over 200 river stations in the three basins are given in table 1. Table 2 lists crest stages of outstanding floods at 21 stations to show the relative magnitude of the 1969 flood.

A few photographs have been included to illustrate the physical extent and severity of the snowmelt floods.

FLOOD AREA

The flood area covered portions of three major basins, namely: the Red River of the North, the Upper Mississippi, and the Missouri. It covered portions of 10 states: North Dakota, Minnesota, Wisconsin, Iowa, Illinois, Missouri, Kansas, Nebraska, South Dakota, and Montana (fig. 6). Not shown in figure 6 is the upper portion of the Missouri Basin where some record flooding occurred on the Yellowstone River in eastern Montana.

The Red River of the North adjoins the Mississippi System on the north but is not a part of it. It rises in the lake region of west-central Minnesota, not far from the headwaters of the Minnesota River. It is formed by the confluence of the Ottertail and Bois de Sioux Rivers, and then flows northward 400 miles to the Canadian border, forming the boundary between Minnesota and North Dakota. It is the largest northward flowing river in the United States. The Red River of the North below Emerson, Manitoba, drains an area of 40,200 square miles (excluding the Souris River Basin but including 3,800 square miles of closed basins in North Dakota).

The Upper Mississippi Basin drains an area of 188,000 square miles. The Missouri Basin drains an area of 529,400 square miles; however, less than 15% of the basin had severe flooding during the snowmelt floods of 1969.

ANTECEDENT CONDITIONS

The potential for major spring flooding was first noted during the fall months of 1968. Above-normal precipitation occurred over much of the Midwest during this period. The winter was one of the worst on record in terms of continued cold weather, heavy snowfall, long duration of snow cover, and high water content of snow cover remaining on ground in early March. Large areas received more than double the normal precipitation for the 5-month period, October 1968 through February 1969 (fig. 3).

Precipitation during October 1968 averaged 2 to 3 times normal over eastern Kansas, eastern Nebraska, and most of Iowa and Minnesota. November was relatively dry but the soil remained wet until freezeup. Heavy snows began Dec. 10 and were repeated 2 weeks later. Light to moderate snowfalls occurred at frequent intervals during January, February, and the first week of March. Large areas had a continuous snow cover for more than 90 days. Because of the cold, cloudy weather, 75% to 85% of the winter's precipitation was still present in the snowpack in early March.

The more southerly location of storm tracks during the 1968-69 winter and the usual temperature gradients in the area produced cold weather, abundant precipitation, and unusual cloudiness. Sunshine was about one-half of normal. Air masses were more humid than usual so that the cold, moist atmosphere and below normal sunshine reduced evaporation from the snow and soil. Temperatures for December and January averaged 5° to 10° below normal. During February temperatures averaged near normal with nighttime minimums above normal but daytime maximum temperatures near or a little below normal. Temperature departures from normal for the 2-month period, December 1968 and January 1969, are shown in figure 2. Temperatures during the first half of March were abnormally cold, averaging several degrees below normal. Very little snow melted during March, except in the southern fringes of the snowpack in Nebraska and southern Iowa.

Average temperatures and accumulated precipitation for selected stations in the Red River of the North, Upper Mississippi, and Missouri Basins for the period November 1968 through March 1969, compared to normal (1931-1960) and other flood years are shown in figure 1. In the Red River of the North Basin at Fargo, N. Dak., the temperatures averaged 15° to 20° below normal during the latter part of December and the greater part of January. During February, the average temperature rose from 15° below normal to 9° above normal at the end of the month. During March, temperatures averaged generally several degrees below normal except above normal in the beginning of the month. Precipitation during the 4-month period, December-March, averaged considerably above normal. Similar temperature and precipitation patterns were observed in the Upper Mississippi and Missouri Basins.

Figures 4A and 4B show the snow accumulation through Jan. 31 and Feb. 28, respectively. The patterns are approximate and are based on preliminary data. Depths within the 20-inch line run up as high as 35 to 40 inches.

The total snow depth in the Upper Mississippi Basin as of Mar. 10 averaged more than 20 inches over the northern half and southwestern third of Minnesota. In the northern half of Wisconsin and the northwestern portion of Iowa the snow depths ranged from 10 to 20 inches.

Figure 5 shows the water equivalent of snow on Mar. 14. In general, the streams with the most serious flood potential were the Red River of the North, Minnesota, Upper Des Moines, Upper Mississippi, Big Sioux, Little Sioux, and the James Rivers. Some of the municipal areas located in regions of potential heavy flooding were: Fargo and Grand Forks, N. Dak., in the Red River of the North Basin; Minneapolis, St. Paul and Mankato, Minn., in the Upper Mississippi Basin; and Sioux City, Iowa, and Sioux Falls, S. Dak., in the Missouri Basin. More than 100 additional municipalities were similarly involved.

Since the snow cover was established early in the season, the soil frost under the snow cover was not unusually deep. However, there was a plentiful supply of available moisture in the heavy snowpack. Infiltration capacities were quickly satisfied, and run-off rates were high.

During December 1968 and January 1969, unprecedented snowstorms were experienced over much of the North Central States. Snow depths ranged up to 275% of normal. By the middle of February it was apparent that disastrous floods were highly probable. Several information releases and public reports were made between Feb. 12 and early March. Operation Foresight (1) was initiated Feb. 28, 1969, by a directive from the President ordering a major effort by federal agencies to reduce or alleviate potential damage from the impending flood.

The Office of Emergency Preparedness, which had overall control of the entire Midwest flood emergency program, reported that "unprecedented advance preparations were tailored to prevent as much fracture as possible." The Environmental Science Services Administration and six other major federal agencies, plus relief agencies, coordinated their efforts in Operation Foresight.

On the basis of Weather Bureau forecasts, mass preparations for protection and evacuation were started. Flood-fighting resources were made available through the facilities of individual states and municipalities, the Office of Emergency Preparedness, Civil Defense, and the Corps of Engineers. Temporary levees were constructed, sandbags stockpiled, factory equipment protected, and movable property evacuated. About 200 miles of temporary levees and dikes were erected or reinforced.

Five states, Minnesota, North and South Dakota, Iowa, and Wisconsin, were designated disaster areas. The Governor of Minnesota declared, "Minnesota citizens were spared what could have been one of the most damaging floods in the state's history through a combination of federal, state, and local efforts."

PREPARATIONS FOR THE SEVERE SNOWMELT FLOODS IN THE UPPER MIDWEST

As a result of the widespread heavy snow cover, the Weather Bureau, Corps of Engineers, and the Bureau of Reclamation started systematic measurements in December and January of the water equivalent of the snow cover in Nebraska and eastern South Dakota. The U. S. Army provided helicopters to go into inaccessible areas where the snow depths and water equivalents were believed to be heavy to obtain special observations during the critical period in the latter half of March. The U. S. Army at Fort Carson, Colo., provided helicopters for snow surveys in the Red River of the North, Big Sioux, and Minnesota River Basins. The helicopters operated out of Fargo, N. Dak., and Sioux Falls, S. Dak. Substation Network Specialists at Fargo and Sioux Falls were responsible for the measurements. They were assisted by members of the local Weather Bureau staffs and the State Climatologist for North Dakota. The use of helicopters permitted access to areas where roads were still closed and facilitated the selection of representative sampling sites.

A pilot project for field investigation of rates of snowmelt was conducted by the Office of Hydrology in the Rock River Basin in northwestern Iowa and southwestern Minnesota. The area investigated was the 788 sq. mi. drainage basin above Rock Rapids, Iowa. The Weather Bureau measured the water equivalent and snow depth at fixed network points. Meteorological data observed at Sioux Falls, S. Dak., and Sioux City, Iowa were supplemented by some observations in the Rock River Basin. The U. S. Geological Survey provided discharge data from its Rock Rapids and Rock Valley stations. Arrangements were made with the Air Force to take sufficient aerial photographs to define the area of snow cover as melting of the snow mantle progressed.

SNOWMELT FLOODS OF 1969

Red River of the North Basin.--Mild temperatures during the first week of April caused the snow cover to ripen and erode. One to 2 inches of rainfall over portions of the basin on Apr. 7-9 hastened the melting process. This was followed by above-normal temperatures causing rapid snowmelt and runoff.

Flooding began along the main stem of the Red River of the North at Wahpeton and Fargo, N. Dak., on Apr. 8. The following day, flooding began along the Red Lake River at Crookston, Minn. The Sheyenne River at Lisbon, N. Dak. rose above flood stage on Apr. 10. On Apr. 11, flooding along the main stem had spread downstream to Grand Forks, N. Dak. By Apr. 16, the Red River of the North was in flood as far downstream as Pembina, N. Dak., and by Apr. 18, down to Emerson, Manitoba. The Red River of the North was several miles wide in many areas from Lake Traverse to the Canadian border. There were several instances where streams moved out of their banks across country to other channels at a lower level, causing heavy property damage.

Heavy snowmelt and ice action brought the Des Lacs River to a crest of 19.8 ft. at Foxholm, N. Dak., on April 10. On the same date, the Souris River, which is joined by the Des Lacs about 7 miles above Minot, N. Dak., rose to a stage of 17.04 ft. at Minot. The city of Minot was inundated to a depth of several feet, with the main crest (20.36 ft.) still 9 days away. More than 11,000 residents were evacuated from their homes before large parts of the city were inundated. The flood in Minot lasted 32 days. Flood damages in the Souris Basin in North Dakota were estimated at over $12 million.

Upper Mississippi Basin.--Precipitation in Minnesota and Wisconsin during April continued below normal for the third consecutive month. Precipitation was light and well spaced except for the concentrated rainfall of 0.75 to 1.5 inches over northwestern Minnesota on April 8-9. The effect of the April rainfall on the snowmelt runoff was slight except in the Upper Minnesota River Basin.

Following the subzero temperatures that occurred over most of Minnesota on March 29-30, temperatures in early April began to warm up with afternoon highs in

the 40's over the snow-covered areas to the 50's elsewhere. Morning lows were all below 32° F. through April 6. From April 7 to the end of the month, afternoon highs were in the 50's and 60's with overnight lows of 32° F. or higher. The rains of April 8-9 combined with the above normal temperatures melted most of the remaining snow cover by April 10. Peak snowmelt runoff occurred with and after the rains. Much of the Upper Minnesota River Valley and the Mississippi River drainage upstream from Minneapolis, Minn., was water-covered on April 7.

Warm weather over central and southeastern Iowa March 15 to 23 caused heavy snowmelt runoff and extensive flooding along the South Raccoon and North Rivers, the entire Skunk River System, the West Fork of the Cedar, Black Hawk Creek, and the Iowa River from Marshalltown, Iowa, to its mouth during the last half of March.

Record flooding occurred on the West Fork of the Des Moines River (fig 7C) at Jackson, Minn., Estherville, Iowa, and Humbolt, Iowa, during April. While the crests occurred during the first half of the month, the flood waters persisted from April 4 to May 2. Flood waters spread over many thousand acres of farmland. Cities along the West Fork had a 2-month warning of impending floods by the Weather Bureau, so were well-prepared for the record flood crests. The more severe flooding on the North Raccoon River at Jefferson, Iowa, occurred Mar. 20 to Apr. 12. Minor flooding occurred Apr. 18 to 20.

The main stem of the Des Moines River began overflowing at Des Moines, Iowa, on Mar. 22. Crests during April at Des Moines were 2 feet lower than in March. Considerable flooding occurred between Fort Dodge, Iowa, and Ottumwa, Iowa, during the period Mar. 22 to Apr. 22 but the degree of flooding was considerably less at other points than at Des Moines.

Minor flooding occurred on streams in Missouri and Illinois. The streams involved were the Salt River in Missouri and the Sangamon, Illinois, Kaskaskia, and Big Muddy Rivers in Illinois. The heaviest flooding occurred on the Big Muddy River at Murphysboro, Ill.

The main stem of the Mississippi River was rising slowly in the headwaters on Apr. 4. The rains on Apr. 8-9 increased the rate of the rise, with the Mississippi spilling out of its banks at Fort Ripley and St. Paul, Minn., on Apr. 9. By Apr. 15, the overflow had spread from Libby, Minn., downstream to Dubuque, Iowa (except at Lansing, Iowa) a distance of 525 miles. By April 25, flooding was in progress as far downstream as Caruthersville, Mo. (107 miles below the mouth of the Ohio). The 1969 flood along the main stem of the Mississippi generally ranked as the second highest flood of record in the reach from Libby, Minn., to Muscatine, Iowa, a distance of nearly 650 miles.

River stage hydrographs of the 1969 and other important floods at various points in the Mississippi Basin are shown in figures 7E and 7F.

Missouri Basin.--March 1969.--Localized flooding occurred on the Sun and Teton Rivers and on Belt Creek in Montana during the latter half of March. Damage resulted to several bridges and other structures due to ice jams. Streams and creeks in the Great Falls, Helena, Denton, and Dillon, Mont., areas rose to a high level due to snowmelt runoff. A small boy drowned in the high water near Stockett, Mont. Most of the damage was due to ice piling against bridge piers and spans.

Overflows occurred along the Yellowstone River from Miles City, Mont., downstream to Sidney, Mont., on Mar. 19-21 due to ice jams. Most of the overflow was confined to low areas. The heaviest damage occurred to crops and buildings. Overflow occurred on the Little Big Horn River, 5 miles upstream from Hardin, Mont., due to ice jams. The overflow reached the interstate highway but little or no damage resulted.

Ice jams on the White River in South Dakota and the Niobrara River in Nebraska caused some local overflows but no damage or livestock loss occurred. The Grand River between Shadehill and Little Eagle, S. Dak., was near bankfull late in March but did not overflow.

The Floyd River rose to 2 to 3 feet below bankfull stage at Alton, Iowa, on Mar. 27 and to near bankfull stage at James, Iowa, on Mar. 24 and 28. Minor rises also occurred on the southern reaches of the Big Sioux, Vermillion, and James Rivers during the last days of March but remained well below bankfull.

Minor flooding occurred along the Elkhorn River near Scribner, Nebr., on Mar. 21 due to a minor ice jam. One county road was briefly inundated in the Scribner area but no damage resulted. Near-bankful stage was reached at Norfolk, Nebr., on Mar. 21 and at West Point, Nebr., on Mar. 22. By the end of March, rivers and streams with the exception of Logan Creek were running open and free of ice. Very little snow remained except in drifts and piles, although there remained a great deal of ponded water.

A heavy snow cover extended over most of the Loup and Platte River Basins in eastern Nebraska and over the Little Sioux River Basin in northwestern Iowa in the beginning of March. Very little snowmelt occurred during the first half of March as the temperatures remained well below normal. During the last half of the month, there were three warm periods followed by cool periods which retarded the snowmelt. Some runoff occurred in the lower reaches of most streams. Local flooding occurred in the lower reaches of most streams. Local flooding occurred in the lower reaches of the Wood River in Nebraska, but it was confined mostly to lowlands and croplands, with some high water over rural roads. The mild spell in mid-March caused snowmelt in the lower reaches of the Loup River Basin in Nebraska, with some lowland flooding due to ice jams near St. Paul, Fullerton, and Columbus, Nebr., on Mar. 19-25. Minor ice jams and flooding occurred on the Platte River near Schuyler, Nebr. Flood damage was relatively minor and occurred mostly in the lower reaches of the Loup River between St. Paul and Columbus, Nebr.

Extensive flooding from snowmelt occurred in the upper Big Blue River Basin in Nebraska on Mar. 18-26. Considerable overflow developed on the Little Blue River at Deweese and Fairbury, Nebr., on Mar. 18-21. The West Fork Big Blue River near Dorchester, Nebr., rose above the 1960 levels but fell considerably short of the historical high-water mark of July 1950 (table 2). Flooding along the main stem of the Big Blue River generally approached the last heavy March overflows in 1960 as far downstream as the Kansas border. Widespread snowmelt surface water accumulations on the tributary streams drained very slowly. Flooding developed from 2 to 5 inches of water equivalent in the old snow cover. Precipitation of 0.5 to 1 inch on Mar. 23-25 in the lower basin served principally to retard falling stages. Damages were locally substantial along the Big Blue near Seward, Nebr., and on the Little Blue in the Fairbury area, but losses were generally light to moderate and confined to the Nebraska portion of the basin.

The Blackwater River at Valley City, Mo., was out of its banks from Mar. 23 to 26, but damage was slight. Some flooding occurred along the Osage River at Schell City, Mo., on Mar. 26-30, but no damage of consequence resulted from the overflow.

April 1969.--Local flooding occurred on the Milk River at Harlem, Mont., on Apr. 5-11 due to snowmelt runoff and minor ice jamming. At least a dozen families were evacuated from their homes at the Fort Belknap Indian Reservation. However, no damage or flood losses were reported.

Severe flooding occurred on the Heart River at Mandan, N. Dak., on Apr. 3-9. The Knife River at Hazen, N. Dak., was in flood during the same period. Spring Creek at Zap, N. Dak., reached a record crest on Apr. 7, overflowing some sections from Halliday, N. Dak., to its confluence with the Knife River. Flooding occurred on most feeder streams in western North Dakota, but the duration was only a few days with the peak of the runoff causing the only flooding of consequence. This flooding was due to the melting of a very heavy snowpack with a high water equivalent.

The gradual warming, interspersed with below freezing nighttime temperatures, caused much of the ice to become rotten and less likely to bridge and cause ice jams. The ice breakup was gradual and there were relatively few serious ice jams.

The heavy snow cover in the James River Basin in the Dakotas had a water content of 4 to 7 inches at the end of March. Warm weather during the first 10 days of April accelerated the snowmelt. Record flooding occurred on the Pipestem River on April 10. The James began overflowing in the lower or southern portion of the basin near Scotland, S. Dak., on Apr. 2. The overflow gradually moved northward to the headwaters near Jamestown, N. Dak., by Apr. 10. The flooding along the James River was the worst of this century. Record flooding occurred from Jamestown, N. Dak., to Redfield, S. Dak. At Huron, S. Dak., the flood crest was the second highest of record (table 2). Flood damage was extensive in the Jamestown, N. Dak., area.

The mayor of La Moure, N. Dak., was warned to prepare for a flood crest of 16 to 17 feet by Apr. 15. Diking was begun during the evening of Apr. 13 and continued all night into Apr. 14. The town was saved from flooding as the flood waters rose to within 3 ft. of the top of the dikes.

Most of the damage in South Dakota was agricultural. More than 60,000 acres of land were inundated. Extensive damage resulted to roads and bridges. Flooding of the James River at Stratford, S. Dak., continued into August.

The water equivalent of the snow cover in the Vermillion Basin in South Dakota was 4 to 7 inches at the end of March. The river rose rapidly to above flood stage near Wakonda, S. Dak., on Apr. 3. The crest reached Davis, S. Dak., on Apr. 7 and Vermillion, S. Dak., on Apr. 10. The major damage was to roads, bridges, and farm property. It is estimated that 40,000 to 50,000 acres were inundated.

Record flooding occurred on the Little Rock River near Doon, Iowa, on Apr. 3-9, and on the Rock River on Apr. 3-12. The flooding in the Big Sioux Basin in South Dakota and Iowa was the greatest in this century. Judged from high-water marks, there are indications that the traditional snowmelt and rain flood of 1881 was larger. Snow cover in late March 1969 in the Big Sioux and Rock River Basins ranged from 5 inches at Sioux City, Iowa, to about 40 inches in the headwaters. The water equivalent ranged from 5 to 8 inches, except in a small area near the mouth of the Big Sioux. Heavy snowmelt occurred as warm weather moved northward. The crests of Apr. 9 and 10 on the Big Sioux exceeded the previous highest stages of record all the way down to Akron, Iowa, (table 2). (Figure 7G shows the river stage hydrograph at Akron, Iowa.) At Sioux City, Iowa, the crest was only 0.2 ft. below the previous highest stage of record measured in 1960. However, the backwater from the Missouri River was substantially less than in 1960. North Sioux City, S. Dak., and Renner, S. Dak., had to be totally evacuated, while only partial evacuation was required at Baltic and Dell Rapids, S. Dak.

Most towns and cities were prepared for the flood and sustained minor damages, and most of the damage was rural. Farmers saved many possessions, but little could be done to save buildings in the flood plain. Livestock loss was small. Extensive damage occurred to roads and bridges between Sioux City and Sioux Falls, S. Dak. About 80,000 to 100,000 acres were inundated.

The mid-March water equivalent of the snow cover in the Floyd River Basin in Iowa was 4 to 7 inches. This was comparable to conditions in March 1962, which produced the largest snowmelt flood of the century. Melting in 1969 was slow to moderate, and covered a period of 10 days. The warming was interspersed with cool days and nights and was instrumental in keeping the 1969 flood from equalling or exceeding the 1962 flood. Most damage was confined to rural areas. An estimated 12,000 to 14,000 acres were inundated. This resulted in only a short delay in fieldwork, so agricultural losses were minimal. Fringe flooding occurred in towns along the river with small damage. Approaches to many bridges were inundated, and Highway 75 was partially closed in low areas.

A heavy snow cover with a high water equivalent existed over the Little Sioux River Basin in Iowa in the beginning of April. Warm weather early in the month caused moderate melting of the snow cover. Figure 7G shows the river-stage hydrograph for Peterson, Iowa. About 100 families were evacuated from their homes.

Warm temperatures on Mar. 31 and Apr. 1 caused a rapid rise of the North Branch Elkhorn River above Norfolk, Nebr. This rise proceeded downstream, producing light to moderate flooding of low-lying areas from Osmond, Nebr., to just north of Norfolk, Nebr. Damage was negligible as the flooding was mainly over agricultural land.

Flooding along tributary streams in southern Nebraska, northern Kansas, and northern Missouri during April was due mostly to rainfall. Heavy tributary flooding occurred in the Kansas River Basin on Apr. 27-28. An 11-foot overflow occurred on Mill Creek at Paxico, Kans. A 6-foot overflow occurred on the Big Blue River at Crete, Nebr., on Apr. 5. Tributary flooding on the West Fork, Turkey Creek, and the Black Vermillion River was moderate to locally heavy. Flooding in the Marais des Cygnes Basin was confined to the headwaters area down to Melvern, Kans., and above Pomona Reservoir on Dragoon Creek.

Flooding along the main stem of the Missouri River was confined to the 562-mi. reach between Nebraska City, Nebr., and the Mississippi. The flooding from the upstream snowmelt runoff was augmented by local rainfall runoff.

SNOWMELT FLOODS IN THE RED RIVER OF THE NORTH, UPPER MISSISSIPPI, AND MISSOURI BASINS - CONT'D

FLOOD DAMAGES

The preliminary estimates of flood damage in the Midwest resulting from the snowmelt floods of 1969 were placed at $175 million. At least 25,000 people were evacuated from their homes. Parts of North and South Dakota, Minnesota, Wisconsin, Iowa, Nebraska, and Illinois were particularly hard hit. Estimates of homeless included 15,000 people in North Dakota, 4,000 in South Dakota, 3,100 in Minnesota, 950 in Illinois, 900 in Iowa, and 800 in Wisconsin. A detailed breakdown of flood damages is not available at this time but will be included in a more comprehensive final report now in preparation.

SAVINGS

Advance planning through Operation Foresight and accurate forecasting averted certain disaster in the opinion of federal, state, and local authorities. A preliminary estimate of savings is that some $250 million in damage was prevented. This figure does not include $86 million in damages prevented due to storage of much of the snowmelt in federal reservoirs in the Upper Missouri Basin.

The cost to the federal government for implementing Operation Foresight was approximately $13.5 million, or only a small fraction of the savings effected.

The Corps of Engineers, chief flood control agency of the federal government, provided assistance in the construction and reinforcement of levees. The funds spent for this were estimated as about one-fourth the amount that would have been needed if Operation Foresight had not been in effect. The Corps of Engineers provided 10 million sandbags, built more than 200 miles of emergency dikes, and approved construction contracts in some 400 communities. All these operations were instrumental in preventing millions of dollars in property losses (2).

The Corps of Engineers placed 1,000 technical experts or engineers in critical areas while another 2,100 servicemen and National Guardsmen turned out to fight the floods shoulder to shoulder with townspeople. The American Red Cross served 250,000 meals to the homeless and to the workers. More than 5 million bushels of grain were moved out of flood zones under the supervision of the Interstate Commerce Commission.

FLOOD WARNINGS ISSUED BY ESSA,WEATHER BUREAU

Ample warnings issued by the Weather Bureau of the high flood potential existing in the Upper Midwest due to the heavy snow cover and high water equivalent. Flood potential forecasts were started by the Weather Bureau at Topeka, Kans., in early January and at Minneapolis, Minn., in mid-January.

The first 1969 Spring Snowmelt Flood Outlook was issued by the River Forecast Center at Kansas City, Mo., on Feb. 11. Flood outlooks were given in general terms by comparison with the snowmelt floods of 1952 and 1965. Similar general outlooks were issued on Feb. 20 and 27 and on Mar. 6. On Mar. 13 and 20, the outlooks furnished crest-stage forecasts for over 200 river stations in the Red River of the North, Upper Mississippi, and Missouri Basins. On March 21, the Weather Bureau Regional Office at Kansas City, Mo., issued a comprehensive report (3) on the flood potential and the meteorological conditions leading to the critical situation.

The early outlooks and crest forecasts were remarkably accurate. The first snowmelt outlook provided an average lead time of about 4 weeks. Refinements in forecasts were made as the weeks passed and the floods progressed to the peaks. Most of the revised forecasts had a lead time of from 1 day to 1 week and verified within tenths of a foot.

ACKNOWLEDGMENTS

M. M. Richards, Chief, Hydrologic Services Division, provided general guidance and supervision in the preparation of this report. V. Alexander, Regional Hydrologist, Central Region, and E. Balke, Asst. Regional Hydrologist, coordinated collection of field data, contributed advice on the preparation of the manuscript, and reviewed the preliminary draft. R. Johnson, Hydrologist in Charge, and staff, River Forecast Center, Kansas City, Mo., made the accurate and timely river forecasts mentioned in this report. The Central Region Headquarters at Kansas City provided the basic maps (3) used in the preparation of figures 2 and 5.

The Meteorologists in Charge at the following Weather Bureau Offices provided the basic river data used in this report: Billings, Mont.; Bismarck, N. Dak.; Des Moines, Iowa; Helena, Mont.; Kansas City, Mo.; Moline, Ill.; Minneapolis, Minn.; Norfolk, Nebr.; Omaha, Nebr.; St. Louis, Mo.; Sioux City, Iowa; Topeka, Kans.

The Corps of Engineers provided the information on flood damage and flood control operations, and the Geological Survey coordinated crest-stage data.

Drafting of figures was by ESSA Graphics Branch.

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

APRIL 1969

Elmer R. Nelson, Office of Hydrology

The most significant flooding during April was the snowmelt floods in the Red River of the North, the Upper Mississippi, and Missouri Basins.

In the Red River of the North Basin, the spring flood of 1969 was the greatest since 1897 from the headwaters to Grand Forks, N. Dak. Below Grand Forks, N. Dak., the flood crests were slightly lower than in April 1966. Record stages were reached on the Red Lake River at Crookston, Minn., and on the Sheyenne River at West Fargo, N. Dak. The preliminary estimates of damage in the Red River of the North Basin excluding the Souris Basin was placed at $3.8 million and was considerably lower than in 1966.

In the Upper Mississippi Basin, record flooding occurred on some tributary streams in southern Minnesota and northwestern Iowa. Along the mainstem of the Mississippi, the flooding from the headwaters to Davenport, Iowa, was generally of the second and third magnitudes. In the reach from St. Paul, Minn., to Winona, Minn., and at scattered points to Davenport, Iowa, the flood of 1969 was exceeded only by the record flood of 1965.

In the Missouri Basin, record flooding occurred on some tributary streams in eastern Montana, Nebraska, the Dakotas and Iowa. Flooding along the mainstem of the Missouri River was comparatively light.

ST. LAWRENCE DRAINAGE

Lake Huron.--Heavy local rains near 1 inch from the 16th to the 18th caused a rise to bankfull stage on the Chippewa River at Mt. Pleasant, Mich., on the 19th. No damage resulted from the minor rise.

Lake Erie.--Minor flooding occurred on the St. Marys and Maumee Rivers in Indiana on the 19th and 20th. The St. Marys River at Decatur, Ind., crested 1.5 feet above flood stage on the 19th. The Maumee River at Fort Wayne, Ind., crested 1.1 feet above flood stage on the 20th. The St. Joseph River at Montpelier, Ohio, was out of its banks on the 19th-23d. The crest on the 21st was 2.1 feet above flood stage.

Lake Ontario.--Minor flooding occurred on the Canaseraga Creek at Groveland, N. Y., on the 19th and on the Oatka Creek at Garbutt, N. Y., on the 20th. No damage resulted from the flooding on Oatka Creek where the crest at Garbutt was 0.2 foot above flood stage. Canaseraga Creek crested 1.5 feet above flood stage at Groveland, N. Y. Route 258, west of Groveland, was closed briefly due to the high water.

ATLANTIC SLOPE DRAINAGE

There were three rises to above flood stage on Otter Creek at Center Rutland, Vt., during April. The first rise occurred on the 10-13th; the second, on the 15th-21st; and the 3d on the 23d-25th. Considerable minor lowland flooding occurred during these rises. The most serious condition occurred on the 19th, when overnight rains plus snowmelt caused extensive lowland flooding. Minor lowland flooding and flash flooding of small streams occurred in and near Winooski, Vt., on that date. Also minor lowland flooding occurred on the Lamoille and Missisquoi Rivers.

The second highest freshet since 1955 occurred in New England during April. Flooding along the Connecticut River from central Vermont through Connecticut lasted from 1 day to 3 weeks. Mainly lowland flooding was reported; however, in some areas flood plain structures received some water. A number of Connecticut River tributaries went above flood stage, but no substantial damage was reported. Lowland flooding was also reported along major rivers in Massachusetts, New Hampshire, and Rhode Island. In Maine, flooding occurred along the Saco, Kennebec, and Androscoggin Rivers. Some evacuations were required as some homes, and businesses were flooded. No dollar estimate of damages is available but in comparison with the flood of March 1968, the damage was nominal. Precipitation in New England during April was near or above normal over most of the area, with about 1 to 2 inches above normal over southern Vermont, northern New Hampshire, Massachusetts, and Connecticut. Near or above record amounts of water equivalents were common through central and northern New England.

Moderate to heavy rainfall from the 16th through the 20th caused the Schroon River at Riverbank, N. Y., to overflow its banks on the 16-28th. The crest on the 25th was 2.1 feet above flood stage. There was considerable flooding along its lowland banks and some highways were blocked. Many vacation lodges were flooded along the Schroon, and the banks of Schroon Lake. Heavy rainfall and melting snow on the 23d-25th caused sharp rises in all streams in the Hudson River Basin. Large streams remained well below flood level or about two-thirds bankfull. Small streams and creeks overflowed on the 24-25th, especially north of the Mohawk-Hoosic Valleys where the snowmelt was heavy. No extensive damages were reported.

Precipitation over the Delaware Basin ranged mostly from near 100% up to 120% of normal, except in New York State where amounts ranged from 105% at Liberty to 156% at Claryville. In New Jersey, precipitation ranged from near 90% in the north to 80% in most southern sections, except 60% to 70% of normal in the southwest portion. Rainfall amounts were spread throughout the month with generally heavy amounts on the 5-6th, 17th, 19th, 20th, 22d, 23d, and 24th. Some minor flooding occurred on the East Branch Delaware River with minor flooding in a few low-lying areas in east-central and northeastern Pennsylvania from the heavy showers on the 5-6th. Ground water levels recovered rapidly during April except in southwestern New Jersey. Reservoirs in New Jersey were almost filled or spilling at the end of the month. Storage in New York City's reservoirs in the Delaware River Basin increased 73.7 billion gallons during April and all reservoirs were spilling at the end of the month.

The Tioughnioga River at Whitney Point, N. Y., was above flood stage on the 6th and the Chemung River at Chemung, N. Y., on the 5th and 6th. No damage resulted from the minor overflows.

Minor flooding occurred along the lower Cape Fear River in eastern North Carolina on the 20th-23d. The rainfall over the upper Cape Fear Basin during the 24-hour period ending at 8 a.m., on the 16th averaged near 1.25 inches. No damages were reported.

Minor flooding occurred on the Rocky River at Norwood, N. C., on the 19th. The Lumber River at Lumber, N. C., continued in flood from Jan. 23 to May 5. There were several crests with the highest crest of 10.9 feet (flood stage, 8 feet) occurring on April 24. Swamps and drainage ditches were affected by the prolonged overflow. Shallow flooding occurred along the middle and lower portions of the Pee Dee River in South Carolina during the latter part of April.

Flooding over the Santee River System was the most widespread since August 1967. Crests on the Saluda River at West Pelzer and Chappells, S. C., were the

highest since 1964. These high stages caused Lake Murray to fill rapidly, forcing flood gates to be opened which added to the crest at Columbia, S. C. All streams in the Santee System approached or exceeded flood stage. The Broad River near Gaffney, S. C., reached, but did not exceed, flood stage on the 19th. At Blair, S. C., the crest was 9.5 feet above flood stage on the 19th. The heavy flow from the Broad and Saluda Rivers (Lake Murray) caused the Congaree River at Columbia, S. C., to crest 4.3 feet above flood stage. On the Wateree River, Lake Wateree reached 2.2 feet over the dam but Camden crested 1.6 feet below flood stage. As this water moved into the upper Santee, the flood gates at Lake Marion were opened to allow for this rise. Widespread flooding occurred from Lake Marion to the coast. As the month ended, flooding was still occurring on the lower Santee from Jamestown, S. C., to the coast.

Minor flooding occurred on the North Fork Edisto at Orangeburg, S. C., on the 19th-22d and on the Edisto at Givhans Ferry, S. C., on the 25-28th. Severe urban flooding occurred at Aiken, S. C., from 10.42 inches of rain on the 15th and 16th. The water rose several feet into many homes and some automobiles were completely inundated. Approximately 200 persons were forced to evacuate. The urban flood damage was estimated at $0.5 million.

The light flooding that began on the Savannah River at Clyo, Ga., on Mar. 25 continued until Apr. 9. The crest on Apr. 3 was 1.5 feet above flood stage. Heavy rains caused additional flooding in the central and lower portions of the Savannah River during the last 10 days of April and most of May. The crest at Clyo, Ga., was 5.8 feet above flood stage on the 29th-30th. Flooding continued into May at Millhaven-Wade and Clyo, Ga. Damages in the lower portion were moderate but the overall damage was greatly reduced by the timely and accurate forecasts provided by ESSA Weather Bureau River Forecast Center.

Considerable flooding occurred in the Altamaha Basin during the last half of April. The Ocmulgee River at Macon, Ga., rose above flood stage on the 18th and continued in flood to the 21st. The crest on the 19th was 4.1 feet above flood stage. The Oconee River rose above flood stage at Milledgeville, Ga., on the 19th, at Dublin, Ga., on the 24th and at Mt. Vernon, Ga., on the 26th. The highest crest occurred at Milledgeville on the 20th where it rose 7.7 feet above flood level. It receded within its banks on the 22d-29th. The mainstem of the Altamaha River rose above flood stage at Charlotte, Ga., on the 30th and continued in flood to May 3. The Satilla River at Atkinson, Ga., rose above flood stage on Mar. 19 and continued in flood to Apr. 7. The crest on the 30th was 2.1 feet above flood stage. No damages resulted from the flooding.

EAST GULF OF MEXICO DRAINAGE

Heavy rains on the 17-18th caused considerable flooding on tributaries of the Chattahoochee River in Metropolitan Atlanta, Ga., on the 18th. The Apalachicola River at Blountstown, Fla., was in flood from the 20th to the 26th. The crest on the 22d was 4.9 feet above flood stage. The flood damage in metropolitan Atlanta was confined mostly to water-soaked household furnishings, mud deposits on lawns, and flooded automobiles.

Considerable flooding occurred in the Tombigbee Basin in Mississippi and Alabama during the last two decades of the month. The Old Town Creek at Tupelo, Miss., rose 2.1 feet above flood stage on the 14th and receded within its banks on the same date. The East Fork Tombigbee at Fulton, Miss., the Tibbee River at Tibbie, Miss., and the Noxubee River at Macon, Miss., were out of their banks on the 11-19th. The crests on the 15th ranged from 2.8 feet above flood stage at Fulton, Miss., to 5.6 feet above flood stage at Tibbie. The crest at Macon, Miss., was 4 feet above flood stage on the 14th. The Black Warrior River at Warrior, Ala., was in flood on the 14-20th. The crest on the 17-18th was 3.3 feet above flood stage. The mainstem of the Tombigbee rose above flood stage at Aberdeen, Miss., on the 12th, at Gainesville, Ala., Demopolis, Ala., and Jackson, Ala., on the 14th and at Columbus, Miss., on the 15th. It receded within its banks between the 21st and May 3. The highest crests occurred in Alabama and ranged from 10.7 feet above flood stage at Jackson to 13.1 feet above flood stage at Gainesville. Crests in Mississippi ranged from 6 feet above flood stage at Columbus on the 17th to 7.8 feet above flood stage at Aberdeen on the 15th.

Exceptionally heavy rains on the 9th, supplemented by additional heavy precipitation on the 12th and 13th, produced sharp rises and flooding on streams in the Pearl River Basin. Flooding began between the 11th and 17th and continued into May along the lower Pearl. Scattered heavy precipitation on the 17th helped to maintain the rivers at a high level. Flooding was generally confined to low-lying farm- and timberlands. Flash flooding did some damage to secondary roads in Mississippi where tributaries spilled over the roads causing local washouts. Locally heavy rains (8 inches in 6 hours) inundated major highways in a narrow strip from Beaumont, Miss., to near Waynesboro, Miss. At Laurel, Miss., flash flooding on Tallahala Creek caused the evacuation of 42 families. Some local flooding occurred at Jackson, Miss., when water backed up local creeks and spread into low areas of the town, necessitating the evacuation of 21 families. Flood damage was held to a minimum as the new system of levees built along the Pearl River in the vicinity of Jackson, during the past few years contained the flood waters. Gravel operations on the lower Pearl River and on the Bogue Chitto were interrupted for several days due to the high water. Flood damage was mostly confined to planted low-lying areas in the flood plain and to secondary roads.

MISSISSIPPI SYSTEM

Ohio Basin.--Minor flooding occurred on the Scioto River at Circleville, Ohio, on the 20th. The crest was 0.2 foot above flood stage. This minor overflow was due to moderate rains on the 18th and 19th. No damage resulted.

Heavy rain (1 inch) on the 4-5th over the upper half of the Wabash Basin caused a rise to a little above flood stage in the reach from Lafayette to Terre Haute, Ind., from the 6th to the 11th. Heavy rainfall on the 18th and 19th caused rapid rises to about flood stage or a little higher at numerous points along the Wabash and the upper East Fork of the White River. Crests ranged from 3.5 to 4.5 feet above flood stage along the White River. Some overflow occurred on the Embarrass River in Illinois. Although considerable bottom land was overflowed, no known damage occurred. Flood forecasts by the Weather Bureau were useful for operational and planning purposes and in allaying fears of greater flooding.

There were two periods of overflow on the Saline River

at Harrisburg, Ill. The first occurred on the 9th and 10th with a crest 5.6 feet above flood stage on the 9th. The second overflow occurred on the 14-20th with a crest 7.1 feet above flood stage on the 19th. Flooding was mainly confined to low farm ground with little or no damage except delaying fieldwork.

Minor flooding occurred along the mainstem of the lower Ohio River in the Shawneetown, Ill.-Fords Ferry, Ky., and Grand Chain-Cairo, Ill., reaches. The crests ranged from bankfull at Shawneetown, Ill., on the 24th to 4.8 feet above flood stage at Cairo, Ill. Flooding was mainly confined to low farm ground with little or no damage.

White Basin.--The Black River at Black Rock, Ark., rose above flood stage on Mar. 24 and receded within its banks on April 1. The crest on Mar. 25 was 3 feet above flood stage. It rose above flood stage again on Apr. 4 and continued in flood to Apr. 29. The crest on Apr. 17 was 6.5 feet above flood stage. Upstream at Pocahontas, Ark., the Black rose out of its banks on Apr. 12 and receded within its banks on Apr. 23. The crest on the 16th was nearly 3 feet above flood stage.

The Cache River at Patterson, Ark., continued in flood from Mar. 24 through May 8. The crest on Apr. 15 was 2.3 feet above flood stage.

The White River continued in flood at Clarendon, Ark., from Dec. 27 to May 11, a period of 136 days, and at St. Charles, Ark., from Mar. 25 to May 9, a period of 46 days. At Georgetown, Ark., the White rose above flood stage on Mar. 28 and receded within its banks on Apr. 1. It was out of its banks again on Apr. 5-8 and Apr. 10-26. The crests ranged from 1 to 2 feet above flood stage from Georgetown to St. Charles between Apr. 14 and Apr. 22.

No appreciable damage resulted from the flooding in the White Basin.

Arkansas Basin.--Flooding in the Arkansas Basin during April was confined mostly to streams in southern Kansas during the last few days of the month. The Little Arkansas River at Sedgwick, Kans., rose 2.2 feet above flood stage on the 27th. The Whitewater River at Towanda, Kans., rose 2.6 feet above flood stage on the 27th and receded within its banks on the 28th. The Walnut River at El Dorado, Kans., rose 0.8 foot above flood stage on the 27th and 8 feet above flood stage at Augusta, Kans., on the 28th. The Cottonwood River was in flood from Florence, Kans., to Emporia, Kans., between Apr. 27 and May 1. The crests ranged from 2.3 feet above flood stage at Florence to 6.2 feet above flood stage at Plymouth, Kans. The Neosho River was out of its banks at Americus and Neosho Rapids, Kans., between the 27th and 30th. The crests on the 27th ranged from 2 to 4 feet above flood stage. The rainfall in southern Kansas during April ranged from 100% to 200% of normal. The heaviest precipitation occurred over the Cottonwood and upper Neosho Rivers. The greatest amount was reported at Clements, Kans., with a total of 7.19 inches. The total flood damages in southern Kansas during April was estimated at $196,000.

Minor flooding occurred on the Little Caney River at Copan, Okla., on the 10th. This overflow was due to rainfall averaging 2.25 inches on Apr. 9. No damage was reported from the slight overflow.

Red Basin.--Three to 6 inches of rain in extreme south-central Oklahoma on the 26-27th caused flash flooding of creeks and small tributaries of the Washita River. Minor flooding of bottomlands resulted on the 28th near Durwood, Okla.

The Sulphur and Cypress Rivers in northeast Texas rose out of their banks during the last decade of March and continued in flood to April 3. The cypress River rose above flood stage at Jefferson, Tex., again on Apr. 5-7 and Apr. 17-22. The Sulphur River was in flood between the 12th and 22d. The crests ranged from 2 to 7 feet above flood stage.

The Blue River at Blue, Okla., rose 5.7 feet above flood stage on the 28th. It was in flood from the 27th to the 29th. The Clear Boggy River at Caney, Okla., rose briefly 4.1 feet above flood stage on the 27th. Minor flooding occurred on the Muddy Boggy at Farris, Okla., on the 28th. The crest was 2.6 feet above flood stage. No damages were reported from the flooding.

Lower Mississippi Basin.--Heavy rains during the first 2 weeks of April resulted in 3 feet of overflow along the St. Francis River at Fisk, Mo., and St. Francis, Ark. At Fisk, the river was out of its banks from the 11th to the 24th and at St. Francis from the 10th to the 28th.

The spring rise on the lower Mississippi River began on Apr. 7 with Caruthersville, Mo., reaching 30.5 feet (flood stage, 32 feet.) on the 16-17th. Heavy rains on all tributaries during the next 2 days resulted in a second rise with Caruthersville reaching flood stage on the morning of the 22d. The crest was 33.7 feet on the 27-28th. By the morning of May 1, the river had fallen below flood stage. Upstream at New Madrid, Mo., the crest was 0.4 foot above flood stage on the 26-27th; it was out of its banks on the 25-28th.

Atchafalaya Basin.--Minor flooding occurred on the Atchafalaya River at Morgan City, La., on the 28th. The crest was 0.1 foot above flood stage.

WEST GULF OF MEXICO DRAINAGE

Light flooding occurred on the Mermentau and Calcasieu Rivers in Louisiana on the 13th-23d. The crest on the Mermentau at Mermentau, La., was 3.3 feet above flood stage on the 18th. Crests on the Calcasieu River on the 17-18th ranged from 1 to 2 feet above flood stage. The heaviest rain during the month occurred on the 13th with Mermentau, La., reporting 8.18 inches. No damage resulted from the flooding.

The flooding on the Sabine River in Texas in the beginning of the month was due to heavy rains between Mar. 16 and Mar. 24. The river began overflowing at Mineola, Tex., on Mar. 16 and 2 days later at Edgewood, Gladewater, and Longvieu Bon Wier, Tex., and Logansport, La. Flooding began at Deweyville, Tex., on Mar. 24 and continued until May 4. The Sabine receded below flood stage at all other points by the end of April. Lowlands were flooded along the Sabine and thousands of oilwells were inundated. No other damage was reported.

Flooding was in progress on the Trinity River at Long Lake, Liberty, and Moss Bluff, Tex., in the beginning of April. Flooding began at Liberty, Tex., on Mar. 17 and at Long Lake on Mar. 20. This overflow was due to heavy rains on Mar. 15-18. Additional heavy rains on Mar. 23-24 prolonged the flooding. The overflow at Liberty, Tex., continued to Mar. 28. At Moss Bluff, Tex., the flooding began on Feb. 21 and was still in progress at the end of May. The heavy rains on Mar. 15-18 caused flooding on the Neches near Alto, Tex., on Mar. 15 and at Beaumont, Tex., on Mar. 22. The heavy rains on Mar. 23-24 prolonged the flooding. At Beaumont, the flooding continued until May 26, a period of 66 days. The San Jacinto at Lake Houston, Tex., rose above flood stage on Dec. 1 and was still in flood at the end of May. The crest during April was 45.9 feet (flood stage, 44.5 ft). Heavy rains on Apr. 5 caused flooding on the

Navasota River at Easterly, Tex., on Apr. 6-8. Rains on the 12-13th caused flooding on the Little River at Cameron, Tex., on the 13-14, and flooding on the Neches River at Rockland, Tex., on the 16-19th. Considerable damage occurred to immovable property near the streams due to the extended flooding.

Heavy rainfall on Apr. 11-12 caused minor flooding on the Navidad, Lavaca, and Guadalupe Rivers in Texas. The rainfall amounts ranged from 3 to nearly 6 inches. The heaviest precipitation reported was 5.85 inches at Edna, Tex. Ganado, Tex., reported 5.15 inches. The heaviest rainfall in the Guadalupe Basin was from Cuero southward. Flooding on the Navidad and Guadalupe Rivers began on the 12th and continued through the 17th. On the Lavaca River at Edna, Tex., flooding continued from the 13th to the 15th.

General heavy rains of 2 to 4 inches over the middle and lower Nueces, lower Frio, Atascosa, and Gulf drainage streams caused minor flooding in low-lying areas. No damage resulted. Local heavy rains up to 7 inches on the Texas Coastal Bend caused considerable flash flooding in San Patricio and Nueces Counties, Tex.

GREAT BASIN

Flows on the Humbolt River in Nevada remained excessively high during the first 3 weeks of April. At Palisade, Nev., a crest of 7.7 feet was observed on Apr. 7. It remained above 7 feet from Apr. 3 through Apr. 10. The crest of 7.7 feet was the highest snowmelt crest since May 1952 when it reached a stage of 9.53 feet. However, it was 2 feet below the Feb. 1962 winter flood. From near Beowawe, Nev., downstream about 150 miles to the river's entry into Rye Patch Reservoir, there was overbank flow into pasture- and meadowlands. The flat crest reached the Winnemucca, Nev., area on Apr. 17-18. The rise of the river was gradual and there was very little loss of livestock or farm equipment in the flooded areas. In north Winnemucca, minor flooding occurred on streets immediately adjacent to the river. The water level reached the floor level in a few buildings along the river front. There was little damage in towns from overbank flows since residences and businesses in towns along the Humbolt are mostly away from the immediate flood plain. Erosion damage to bottom lands and damage to county and private roads were quite general. The total volume flow at Palisade in April was 170,000 acre-feet, the third highest monthly amount in 60 years of record.

The City of Ely, Nev., at the mouth of Murray and Robinson Canyons, experienced snowmelt flooding during the first 3 days of April. Daytime snowmelt (primarily from Robinson Canyon) flowed into the main street of Ely in the evening and during the night. From the main street it flowed northward into a rather large residential area. Temporary sandbagging and diking by the citizenry helped to decrease the losses and damages. The total damages were estimated in excess of $100,000.

During the first 3 days of April about 20,000 acres of meadowland near Randolph, Utah, were flooded. This overflow was due to snowmelt discharge from the valley floor and minor tributaries of the Bear River reached 2,000 c.f.s. from a contributing area of about 100 square miles. Damages were light, mostly to roads.

The two small reservoirs above Enterprise, Utah, that filled during March and were spilling continued into April. This was an unprecedented event in recent history. This overflow, combined with the high snowmelt runoff down Schoal Creek, caused considerable flooding in the valley below Beryl Junction. About 2,000 acres of farmland were inundated for almost 1 month. By the end of April, the flooded area was drying out; alfalfa fields were recovering and some replanting was being planned. A few county roads were cut or partially washed out during the flooding.

PACIFIC SLOPE DRAINAGE

San Joaquin Basin.--The San Joaquin River at Mendota, Calif., receded within its banks during April. Due to the release of water from the Terminus, Success, and Isabella Reservoirs, the flooding in the normally dry Tulare Lake Basin increased markedly. There were 73,000 acres containing 524,000 acre-feet of water on Apr. 1 and 78,500 acres inundated containing 746,000 acre-feet of water on Apr. 30.

Columbia Basin.--Some minor flooding occurred in southern Idaho during April. Substantial rises occurred on tributary streams in eastern Washington, eastern Oregon, and the lower Snake but no flooding was reported.

The average stage of the Columbia River at Vancouver, Wash., during April was 12.2 feet. This was 4.2 feet higher than the long term (65-year) normal stage and the 4th highest average April stage of record.

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes, dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G.C.T.

' [illegible] Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

HS Slight haze
HM Moderate haze
HI Intense haze
KS Slight smoke
KM Moderate smoke
( ) Clouds present
* Values corresponding to true solar noon

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1967 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

U Indicates Urban sites.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys. APRIL 1969

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska

APRIL 1969

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	84	93	80	33	-16	20	51	-10	76	68	71	61	45	91	80	102	15	116	144	141	122	110	131	97	145	138	131	162	3	37		81

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the ESSA, Weather Bureau.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (< 3900 Å) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	9.34	10.65	13.97	9.47	16.10	19.41	18.70	8.05	5.92	20.72	15.98	18.35	13.49	3.19	15.39	7.34	2.96	20.95	21.19	10.30	15.51	17.64	11.48	17.40	14.44	3.07	10.18	22.96	20.72	13.61		13.61

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the ESSA, Weather Bureau.

TOTAL OZONE DATA

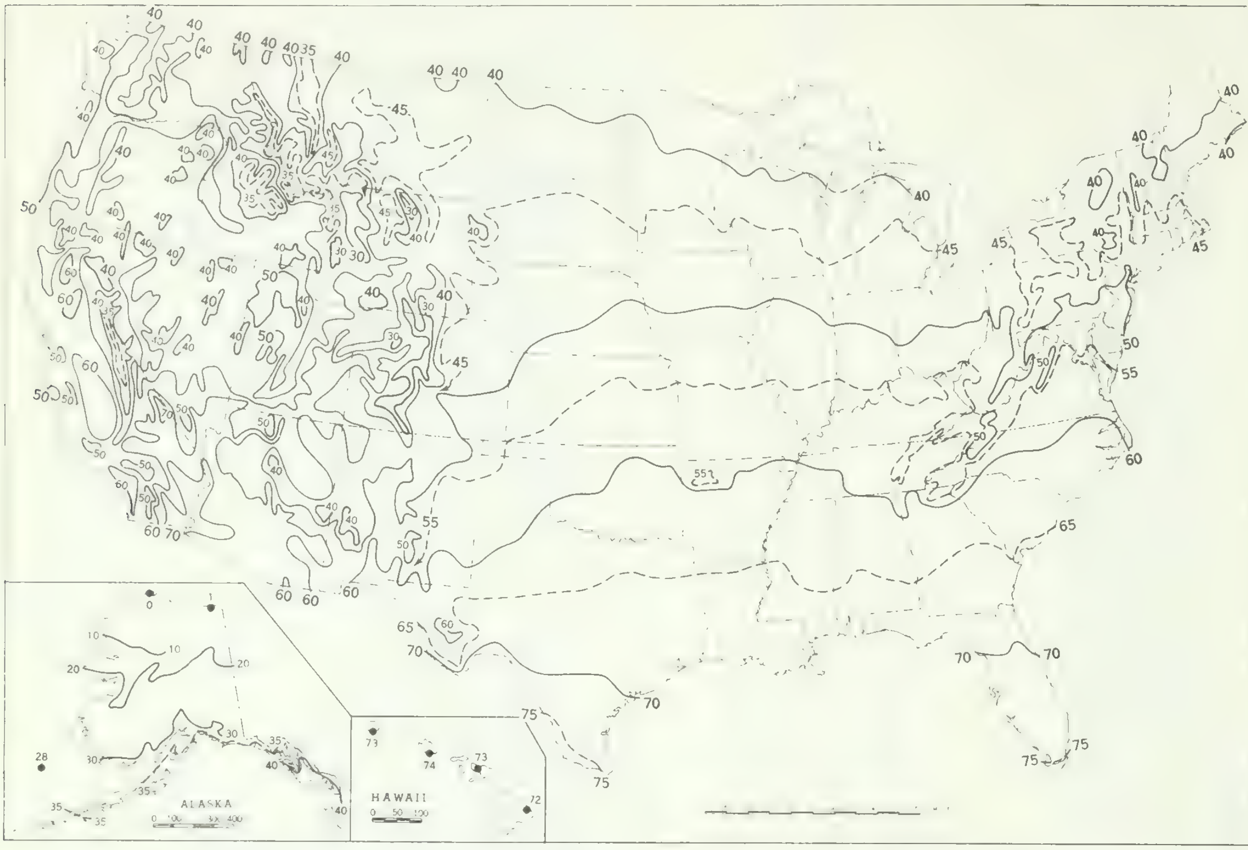
These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code $O_3O_3O_3$ defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units Milli-atmo-cms.

Station	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
	Data will be delayed																															

The spectrophotometer measures the total amount of ozone in the atmosphere, i.e. the amount contained in a vertical column [illegible] extending from ground level to the top of the atmosphere at the location of the station. The amount of ozone in this column (coded $O_3O_3O_3$) is expressed in terms of a thickness of a layer of [illegible] at standard temperature and pressure. [illegible] The code [illegible] designates the type of measurement made.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), April.



B. Temperature Departure from 30 - Year Mean (°F 1931-60), April 1969.

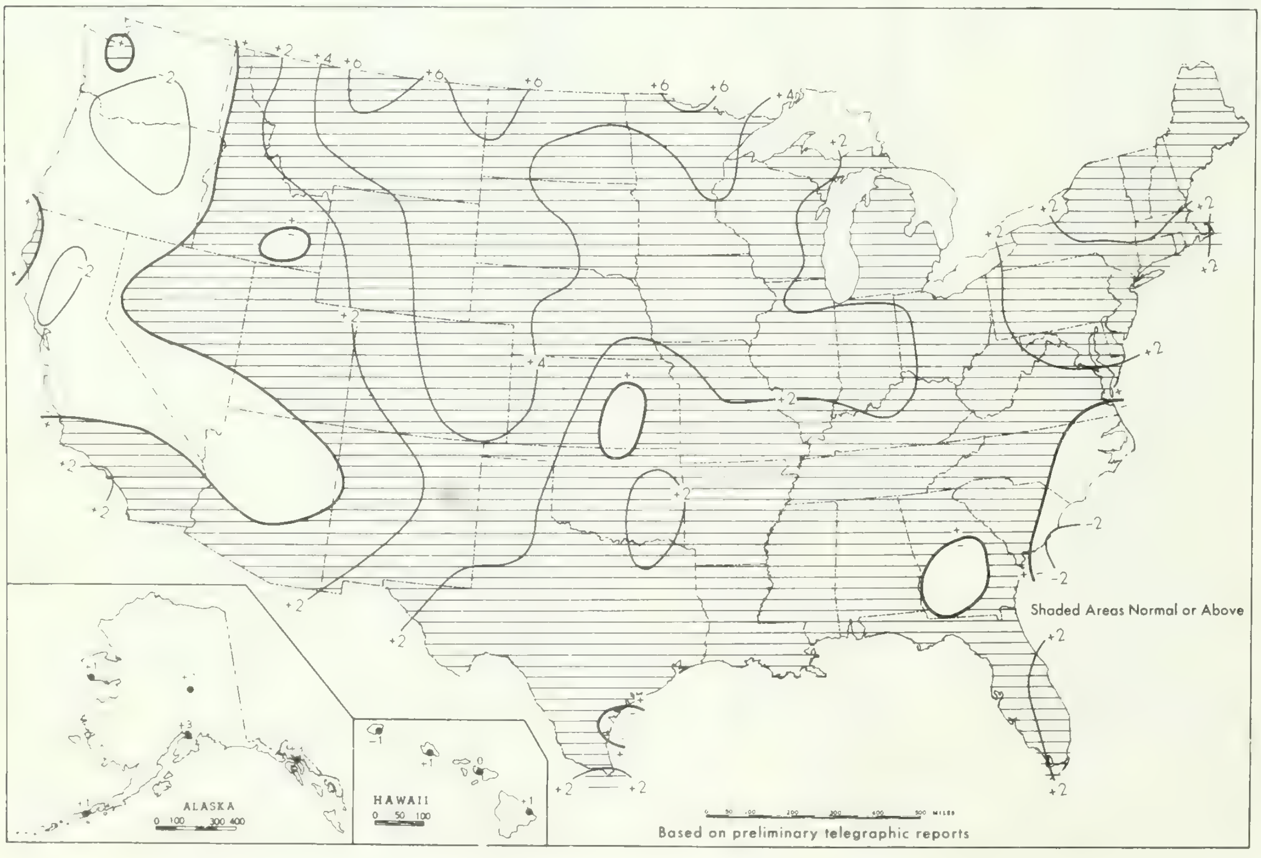


Chart II. Total Precipitation (Inches), April 1969.

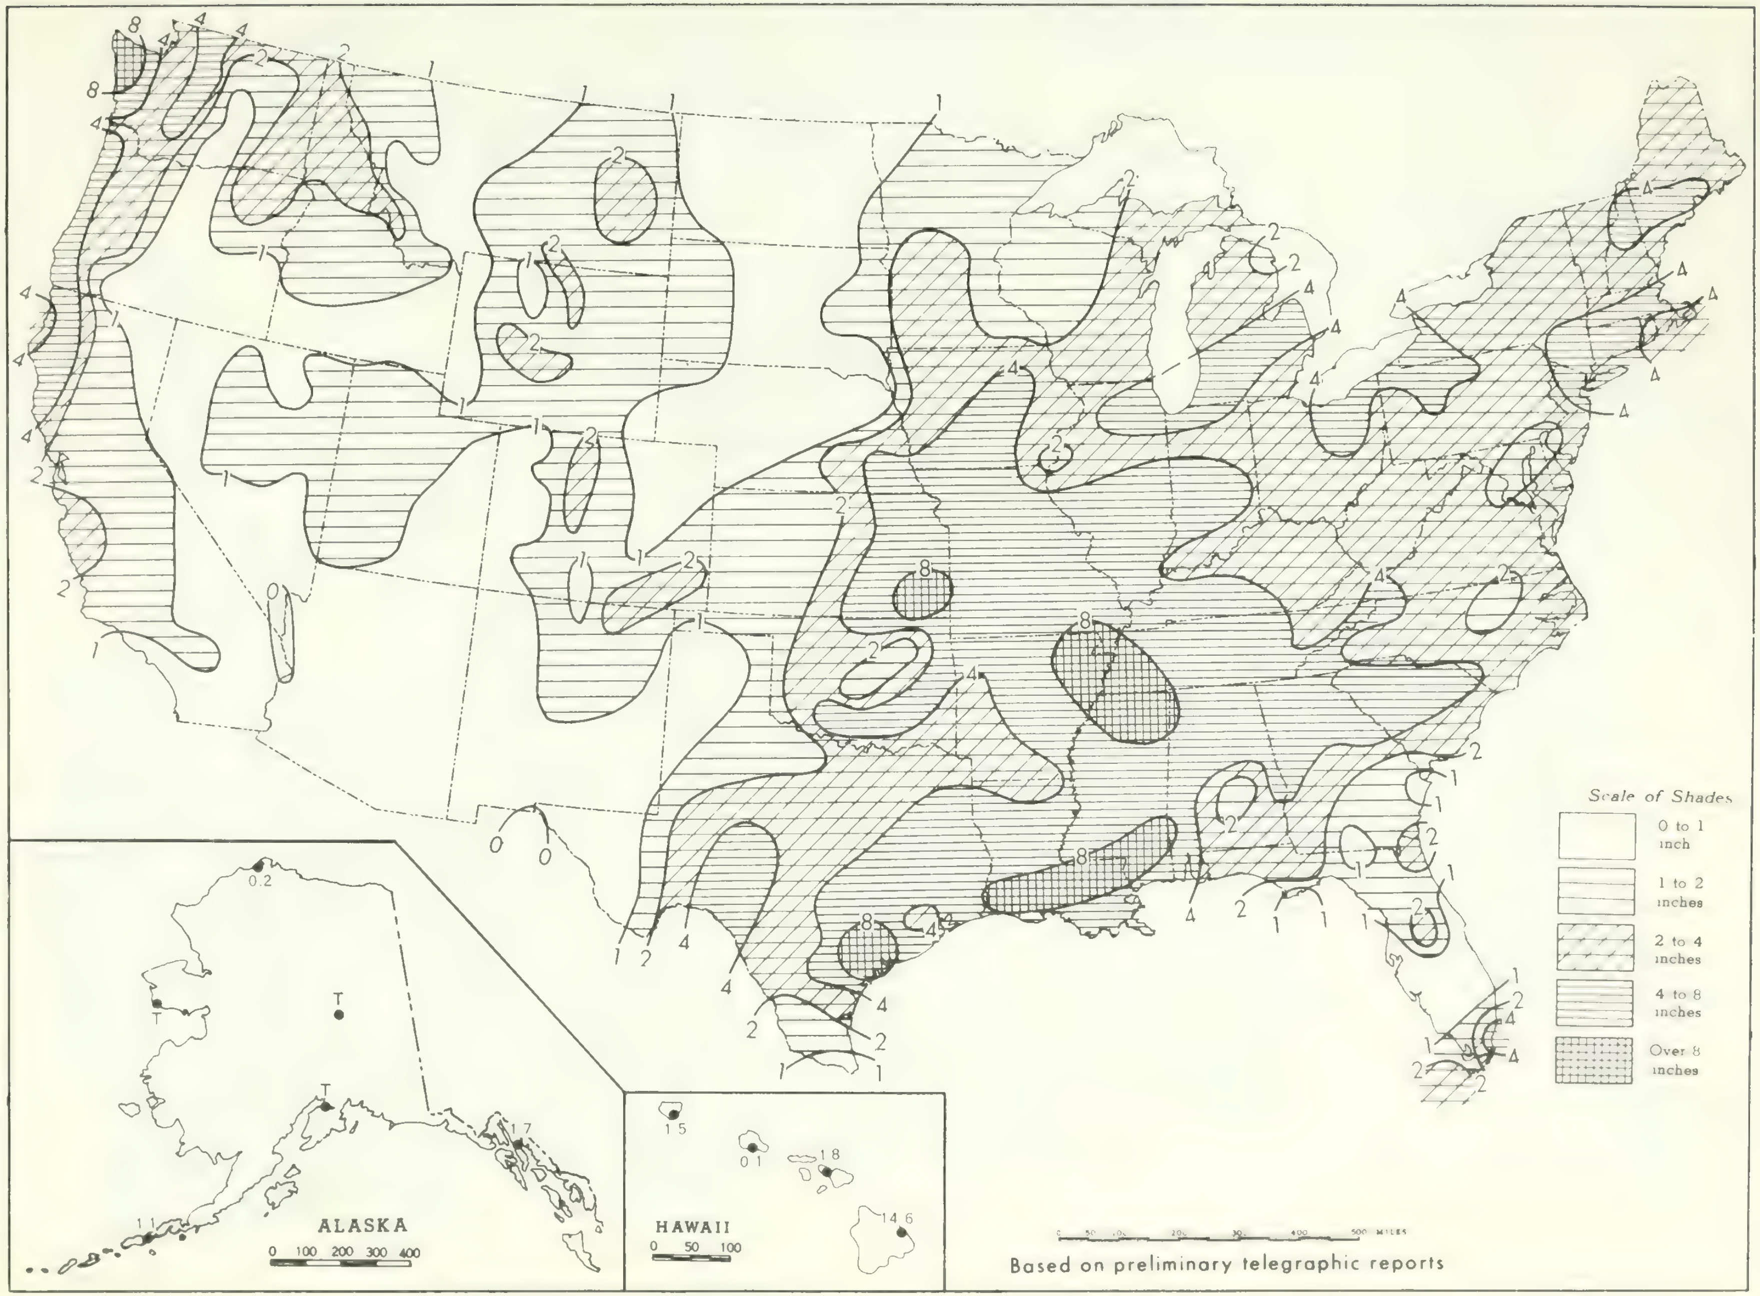

Chart III. Percentage of Normal Precipitation, April 1969.

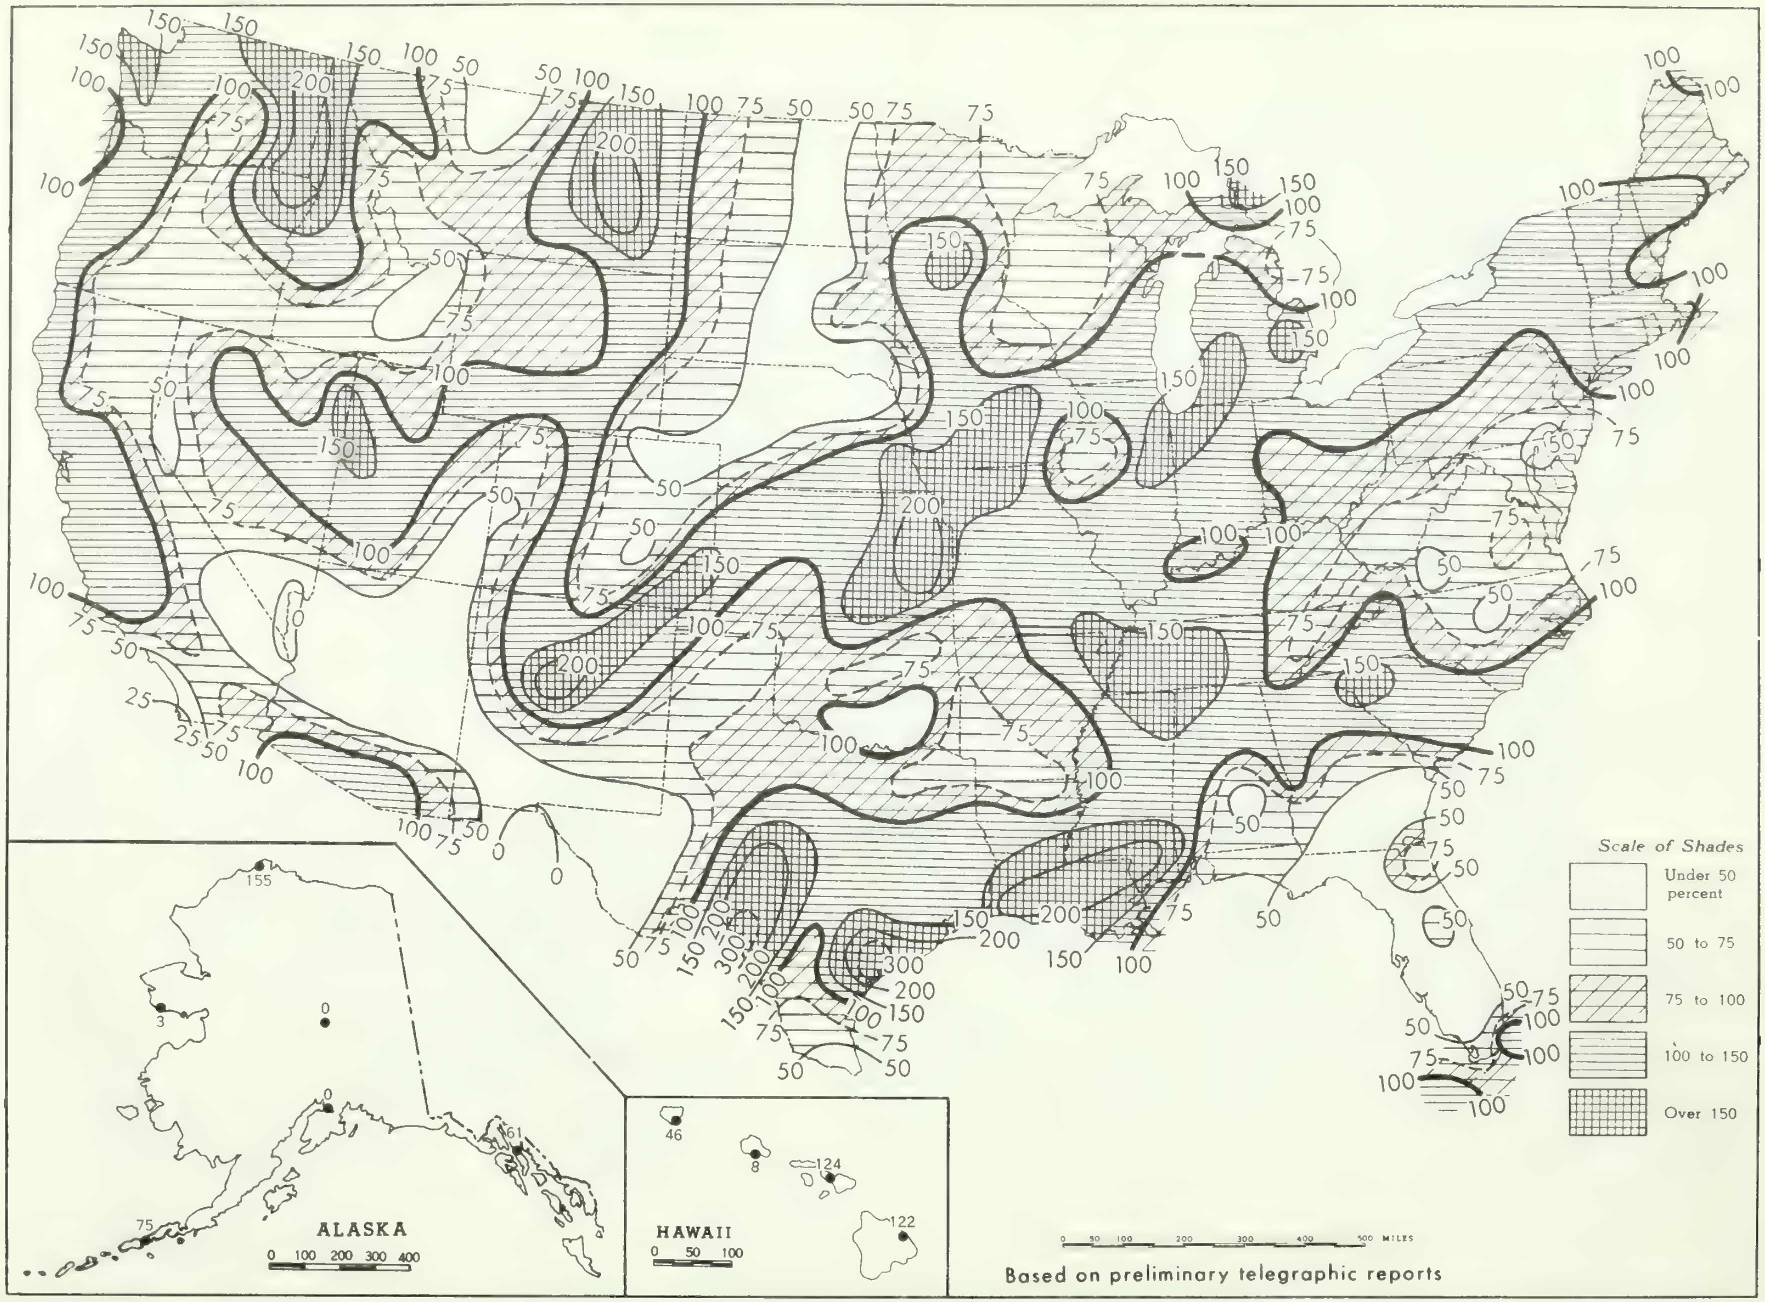
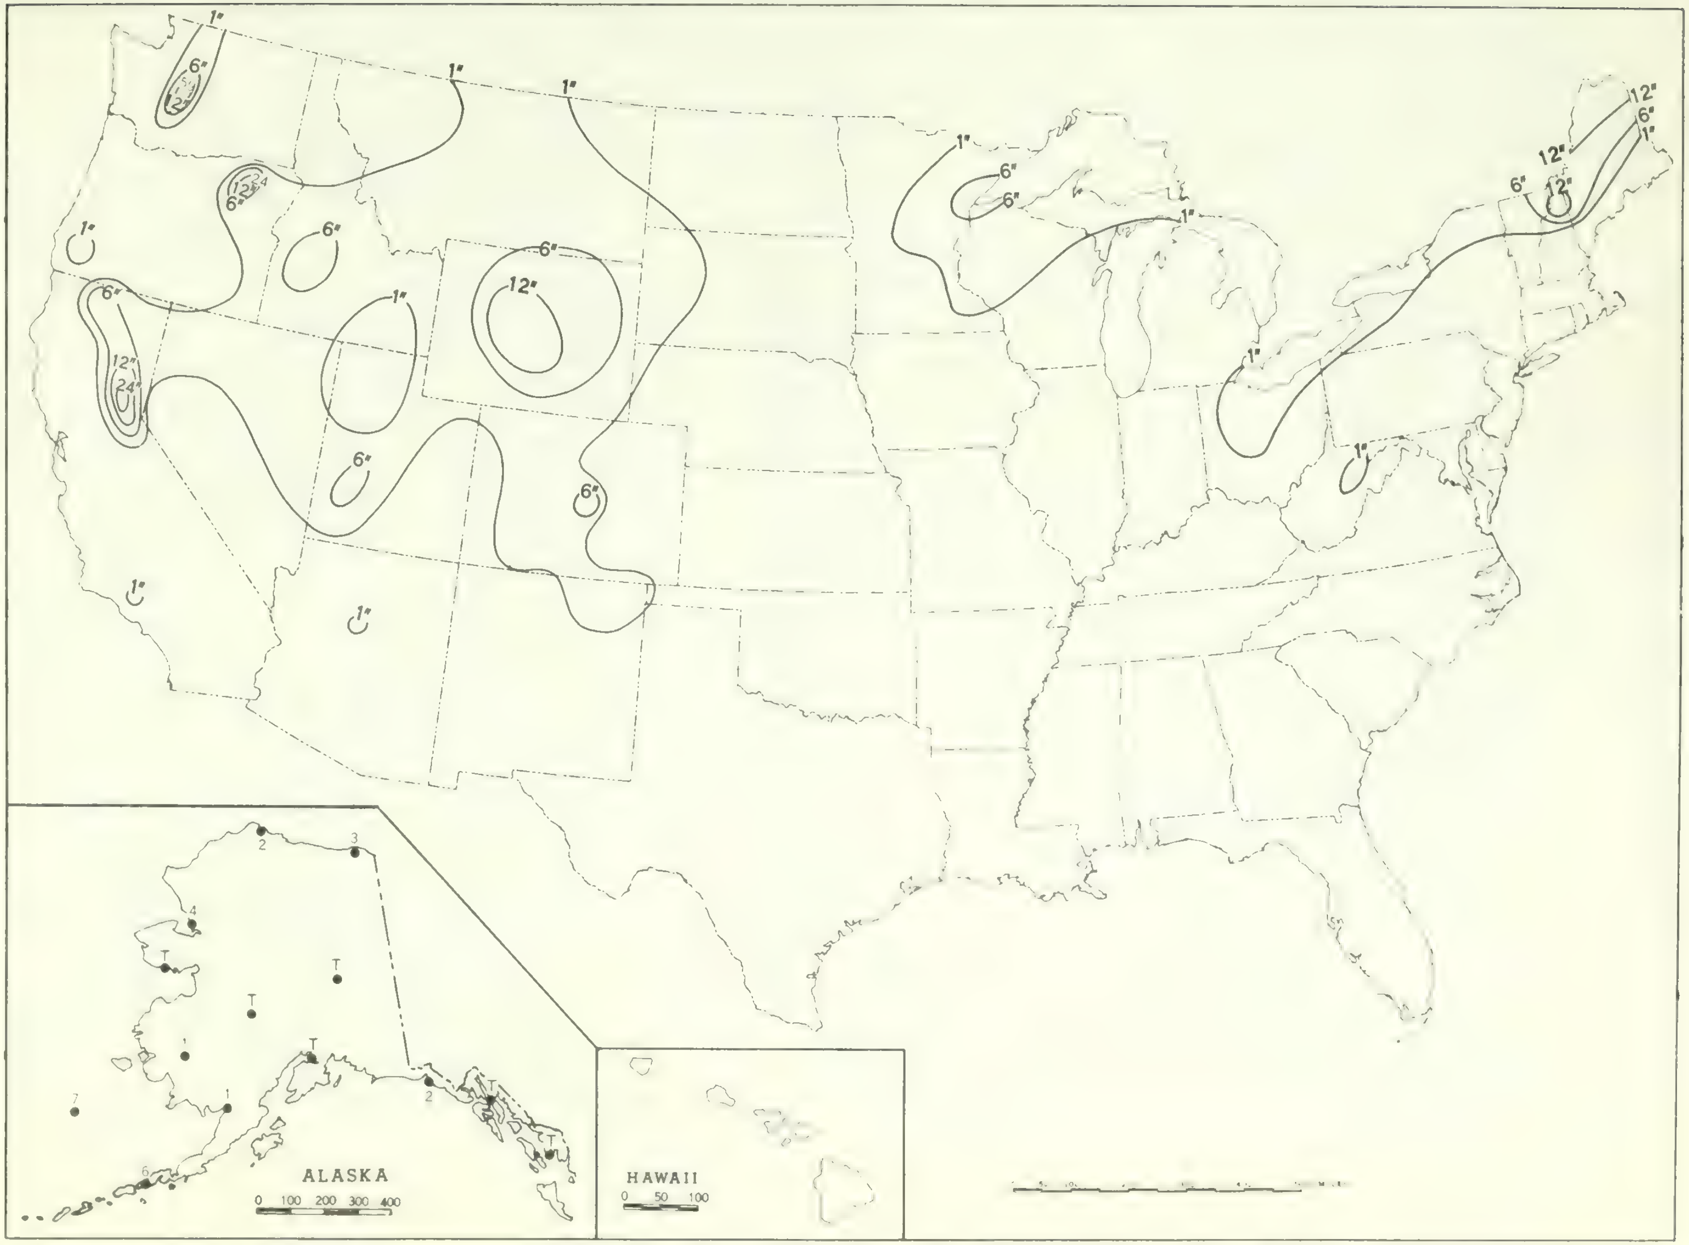


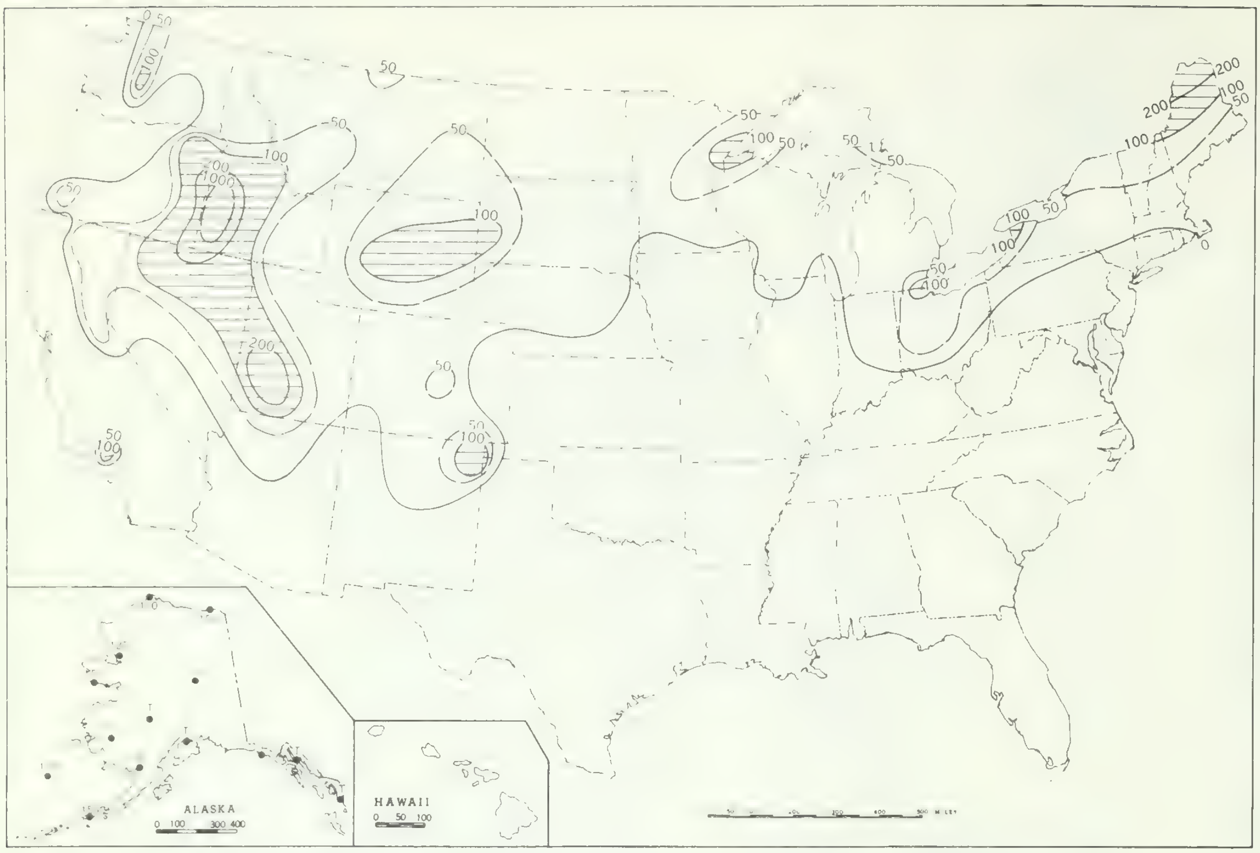
Based on preliminary telegraphic reports

Chart IV. Total Snowfall (Inches), April 1969.

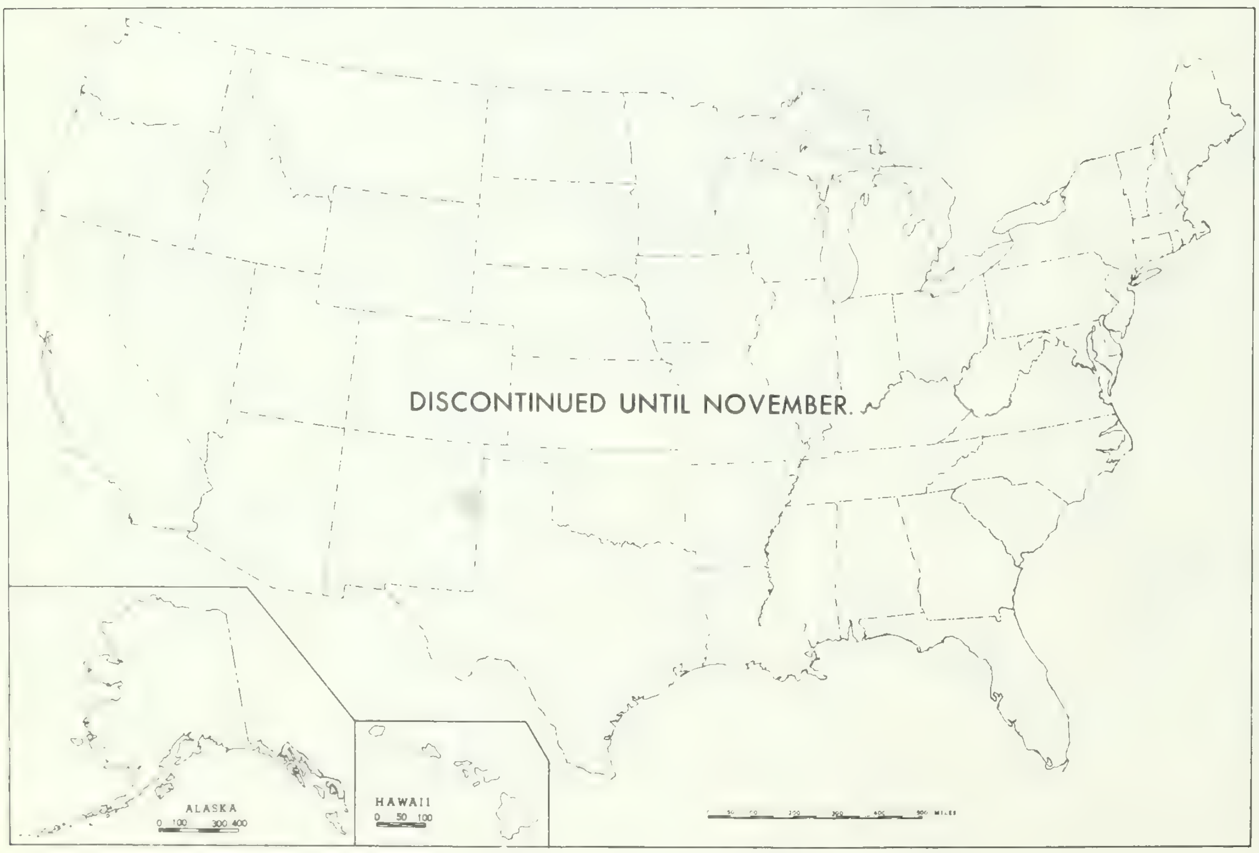


This is the total of unmelted snowfall recorded during the month at Weather Bureau and selected cooperative stations. This Chart and Chart V are published only for the months of November through April, although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year

Chart V. A. Percentage of Mean Monthly Snowfall, April 1969.

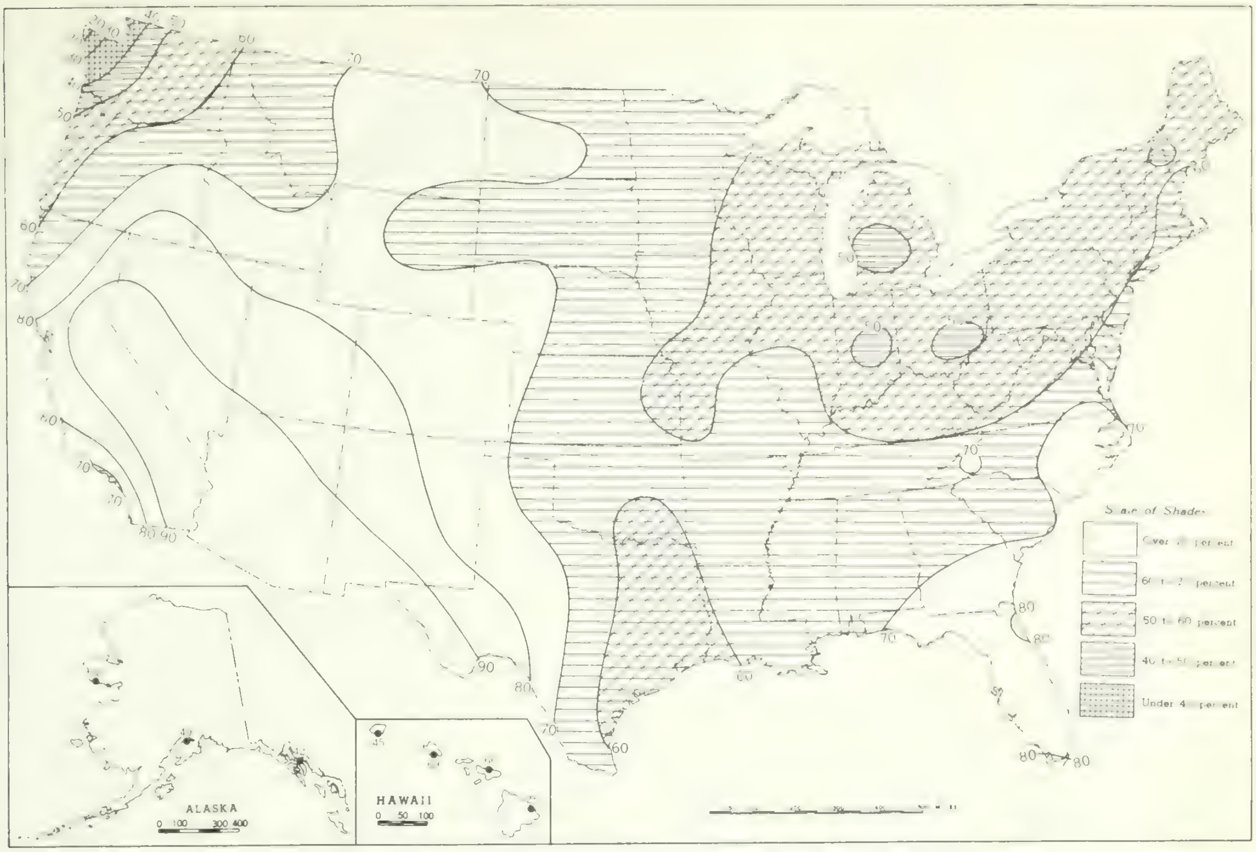


B. Depth of Snow on Ground (Inches), 7:00 a.m. E. S. T., April 1969.

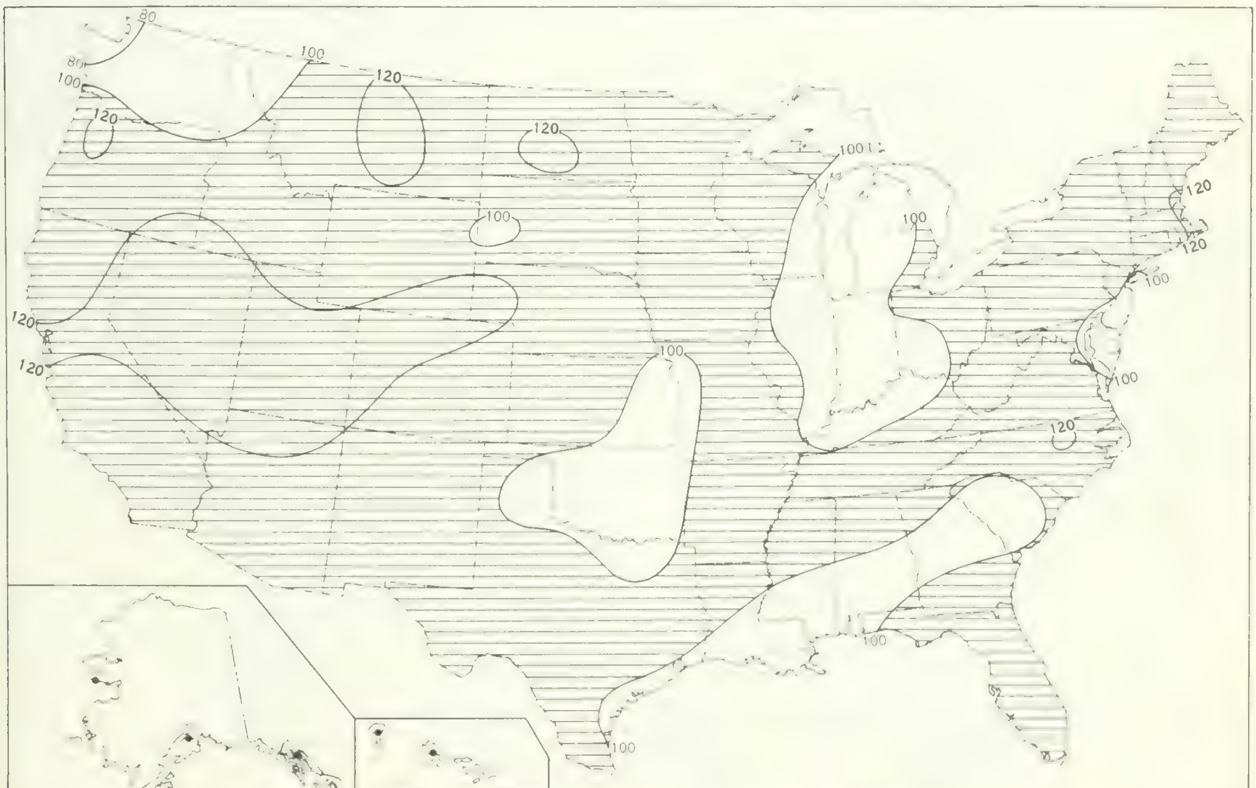


A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a.m. E.S.T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and selected cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, April 1969.

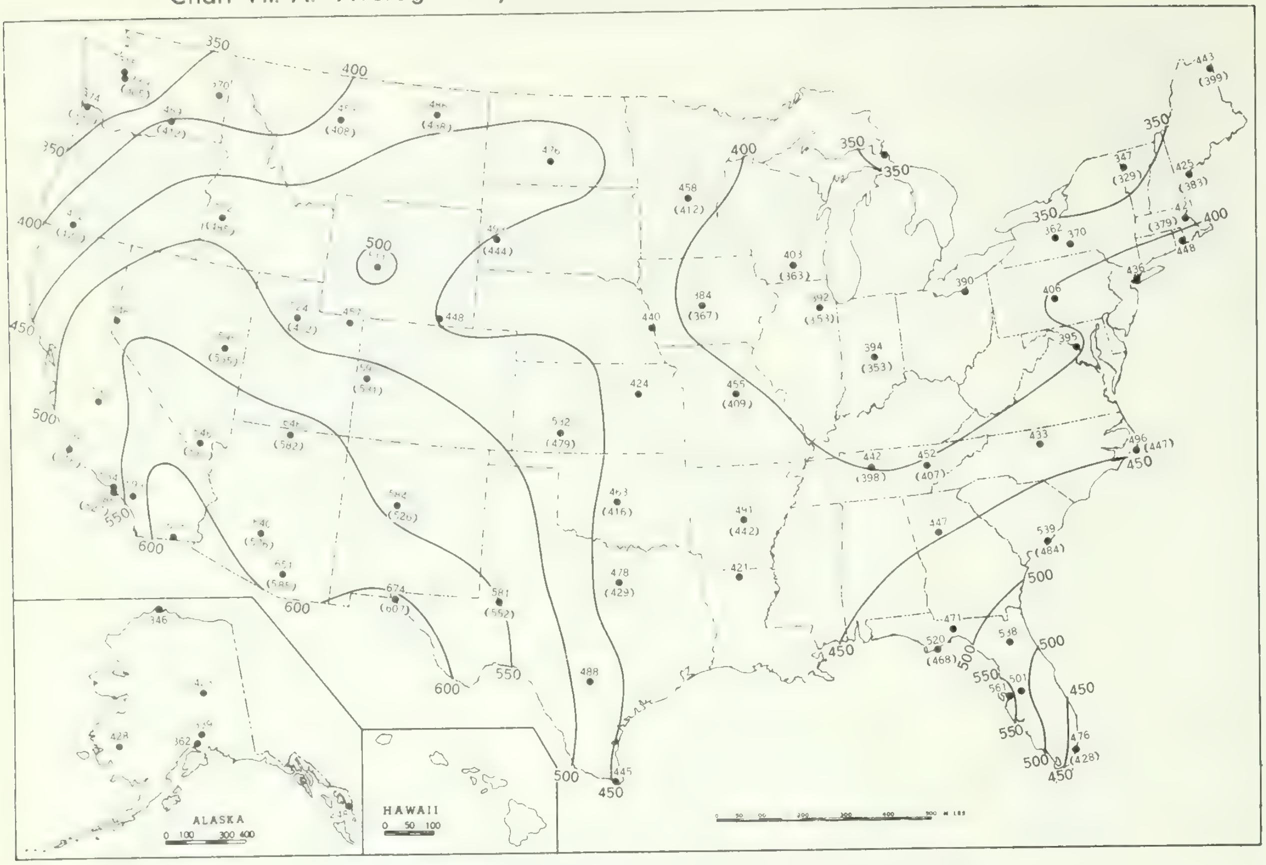


B. Percentage of Mean Monthly Sunshine, April 1969.

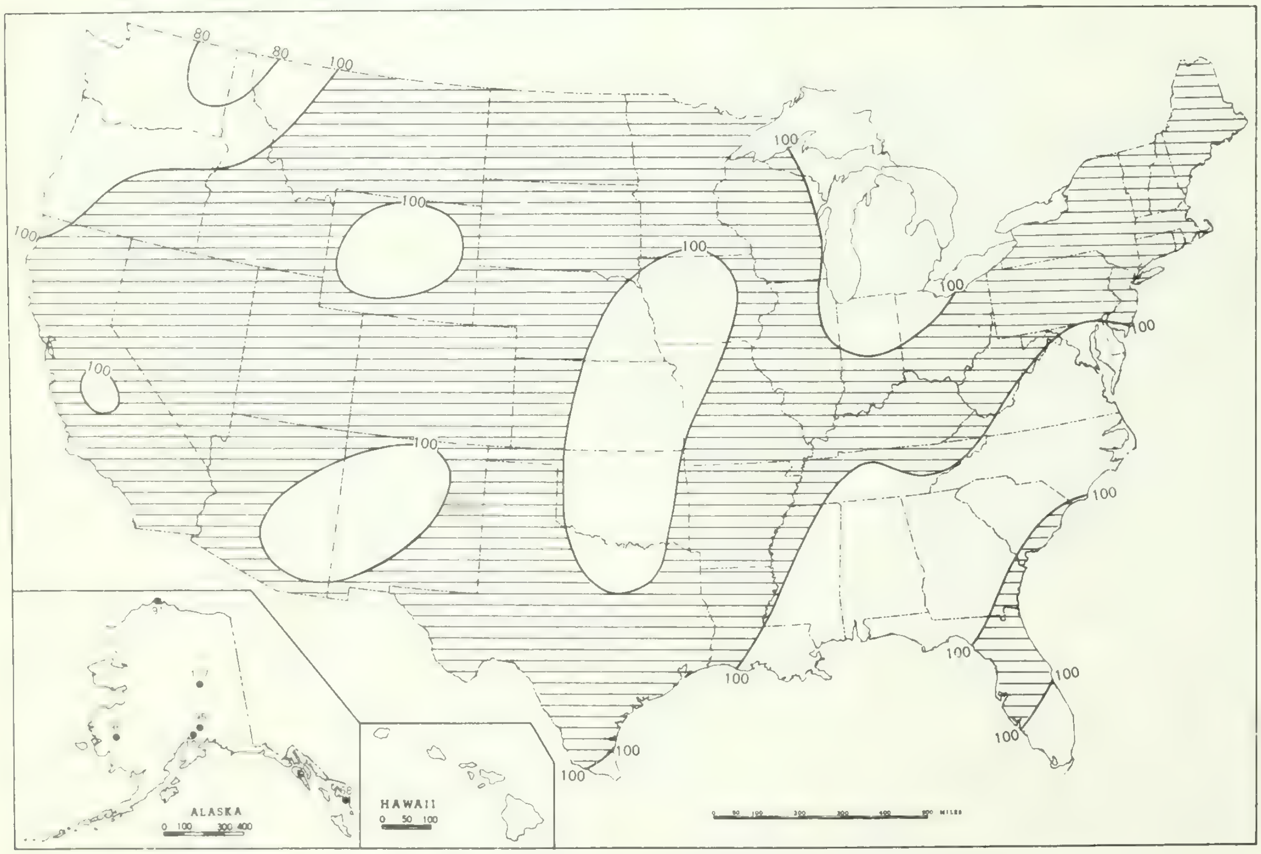


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, April 1969.



B. Percentage of Mean Daily Solar Radiation, April 1969.

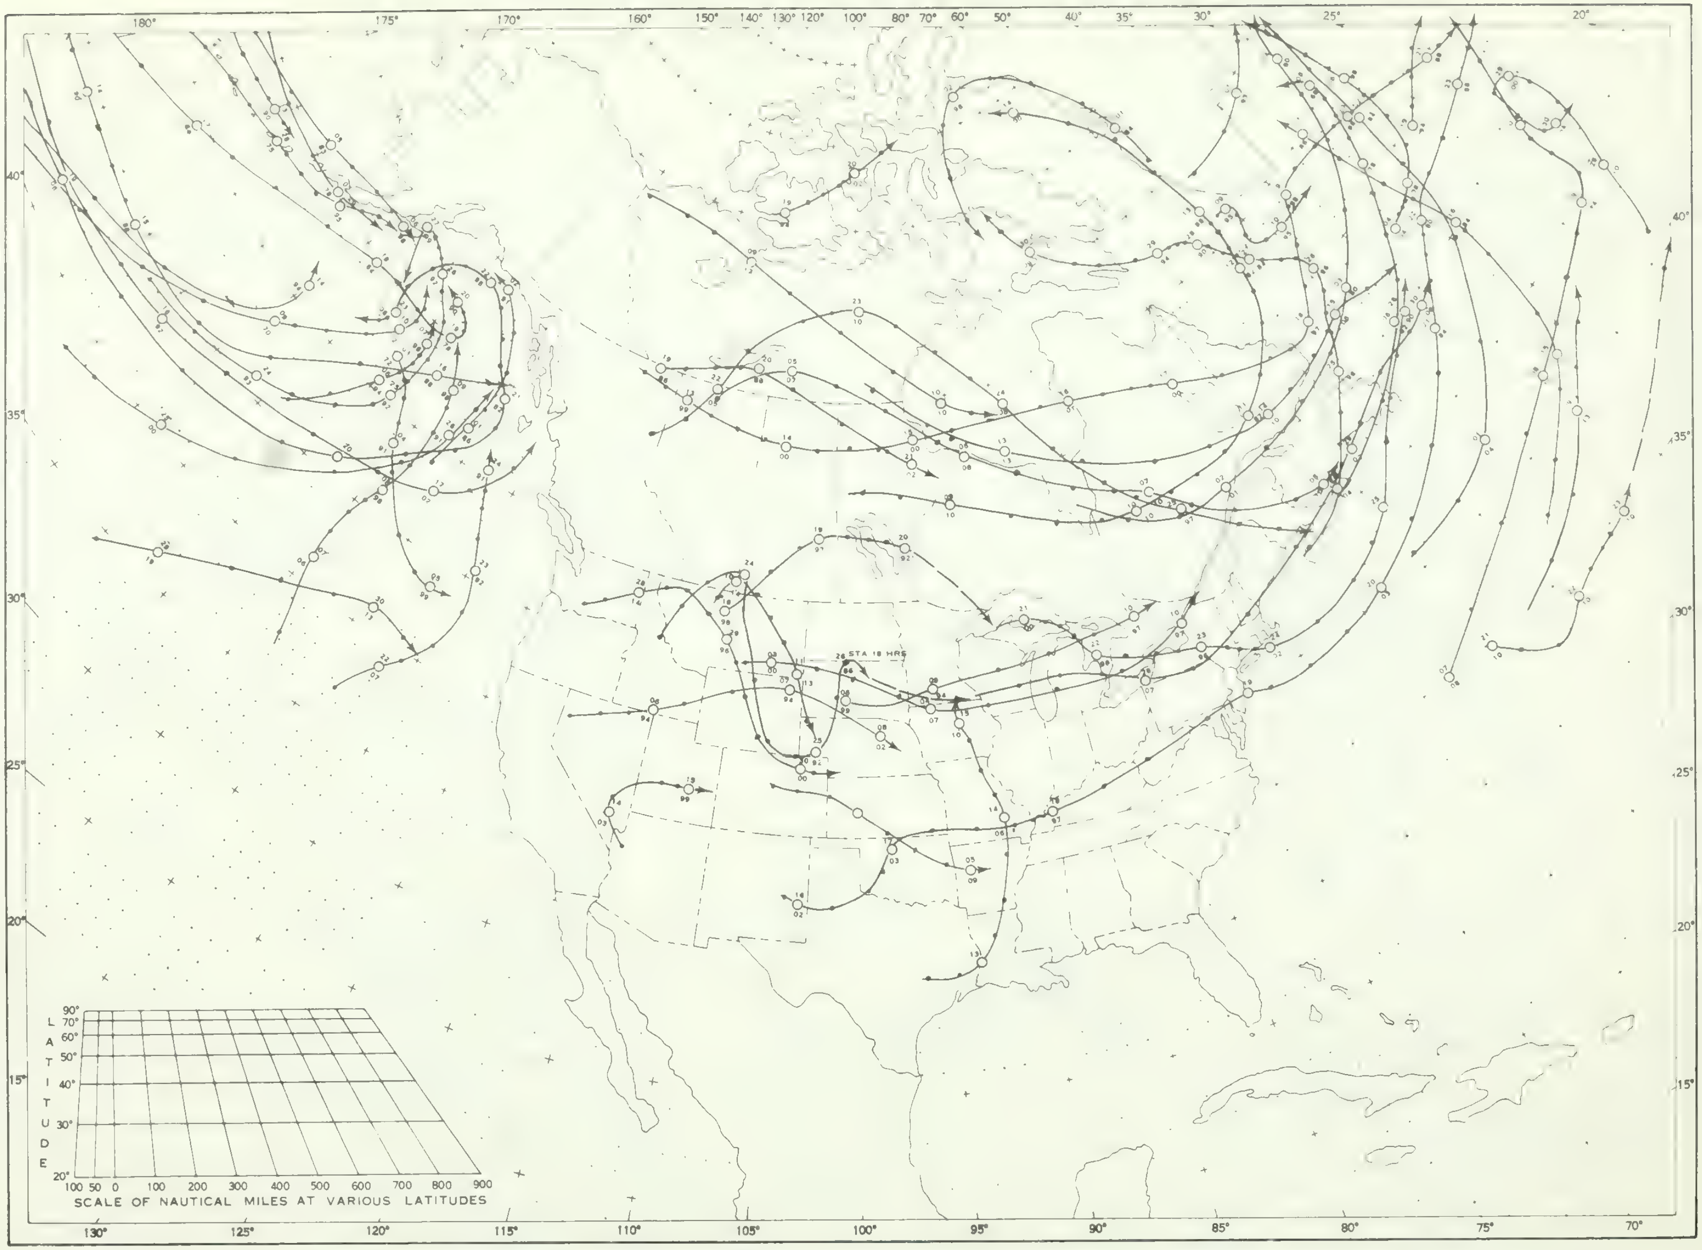


A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, April 1969.

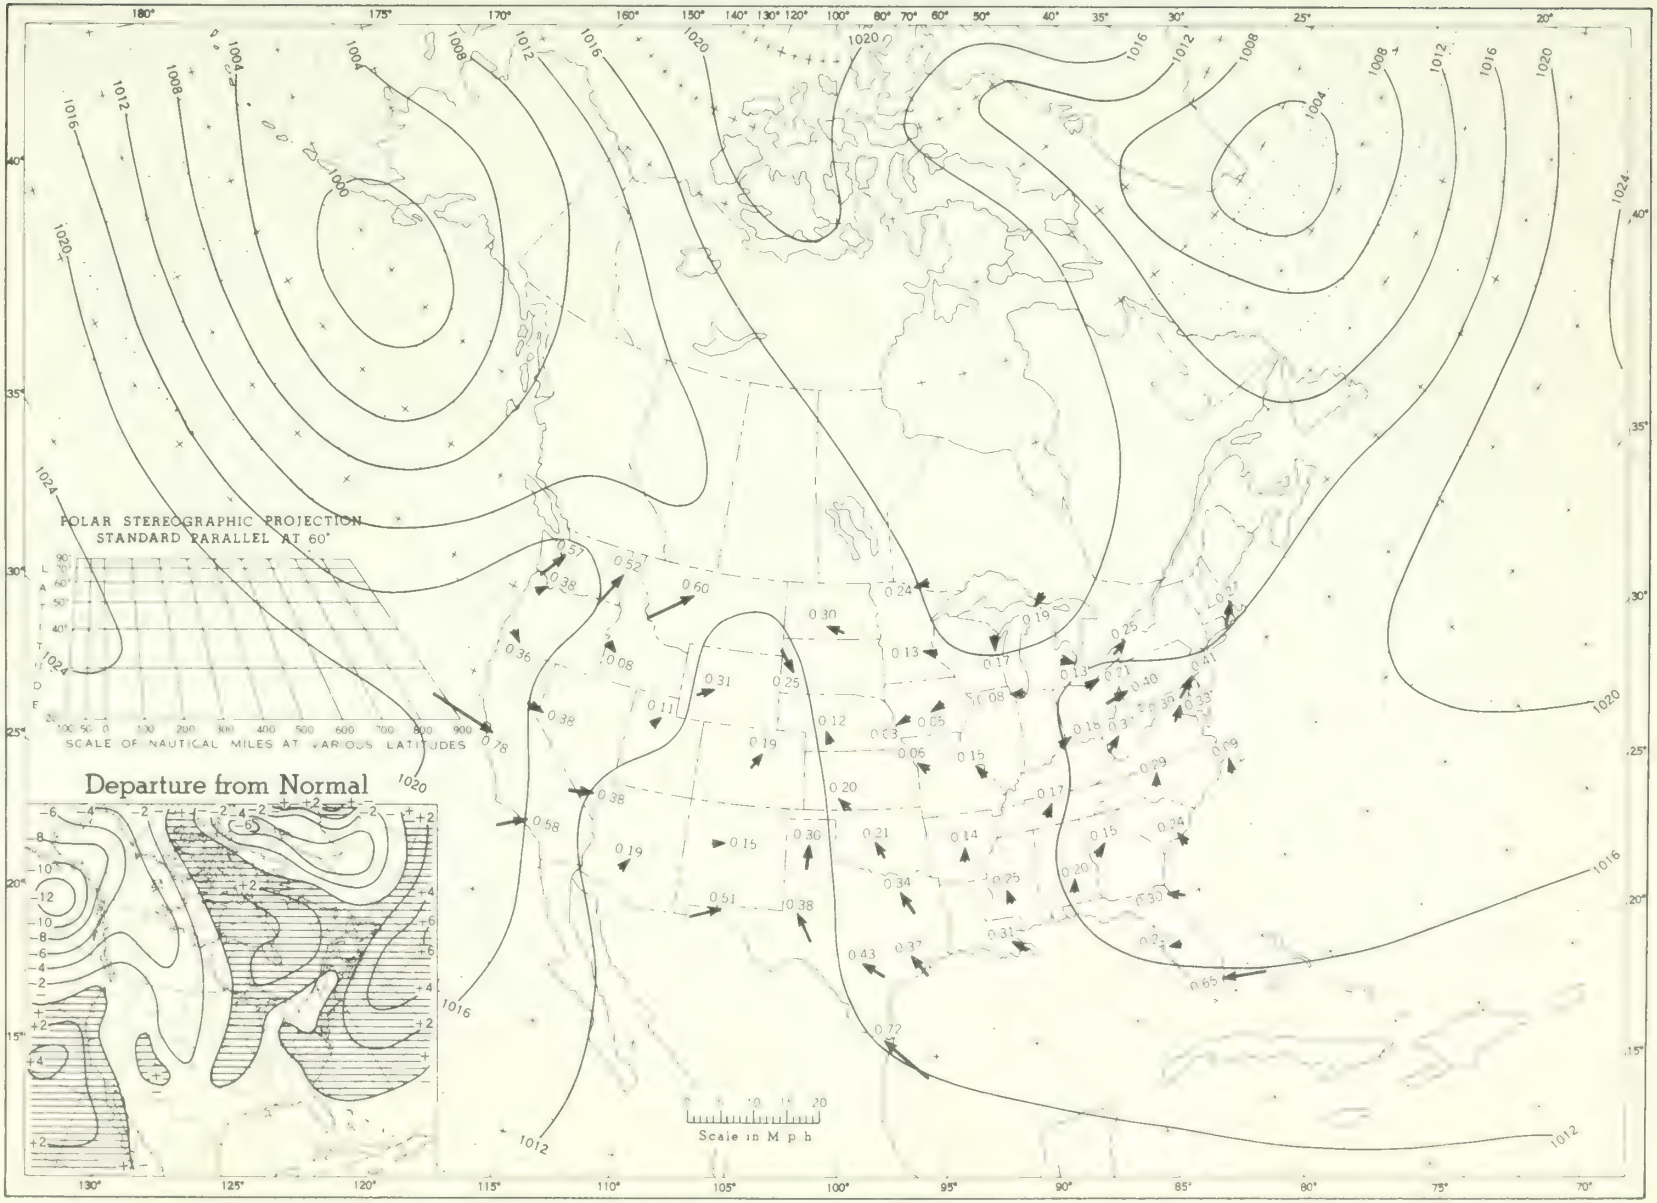
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX Tracks of Centers of Cyclones at Sea Level, April 1969.



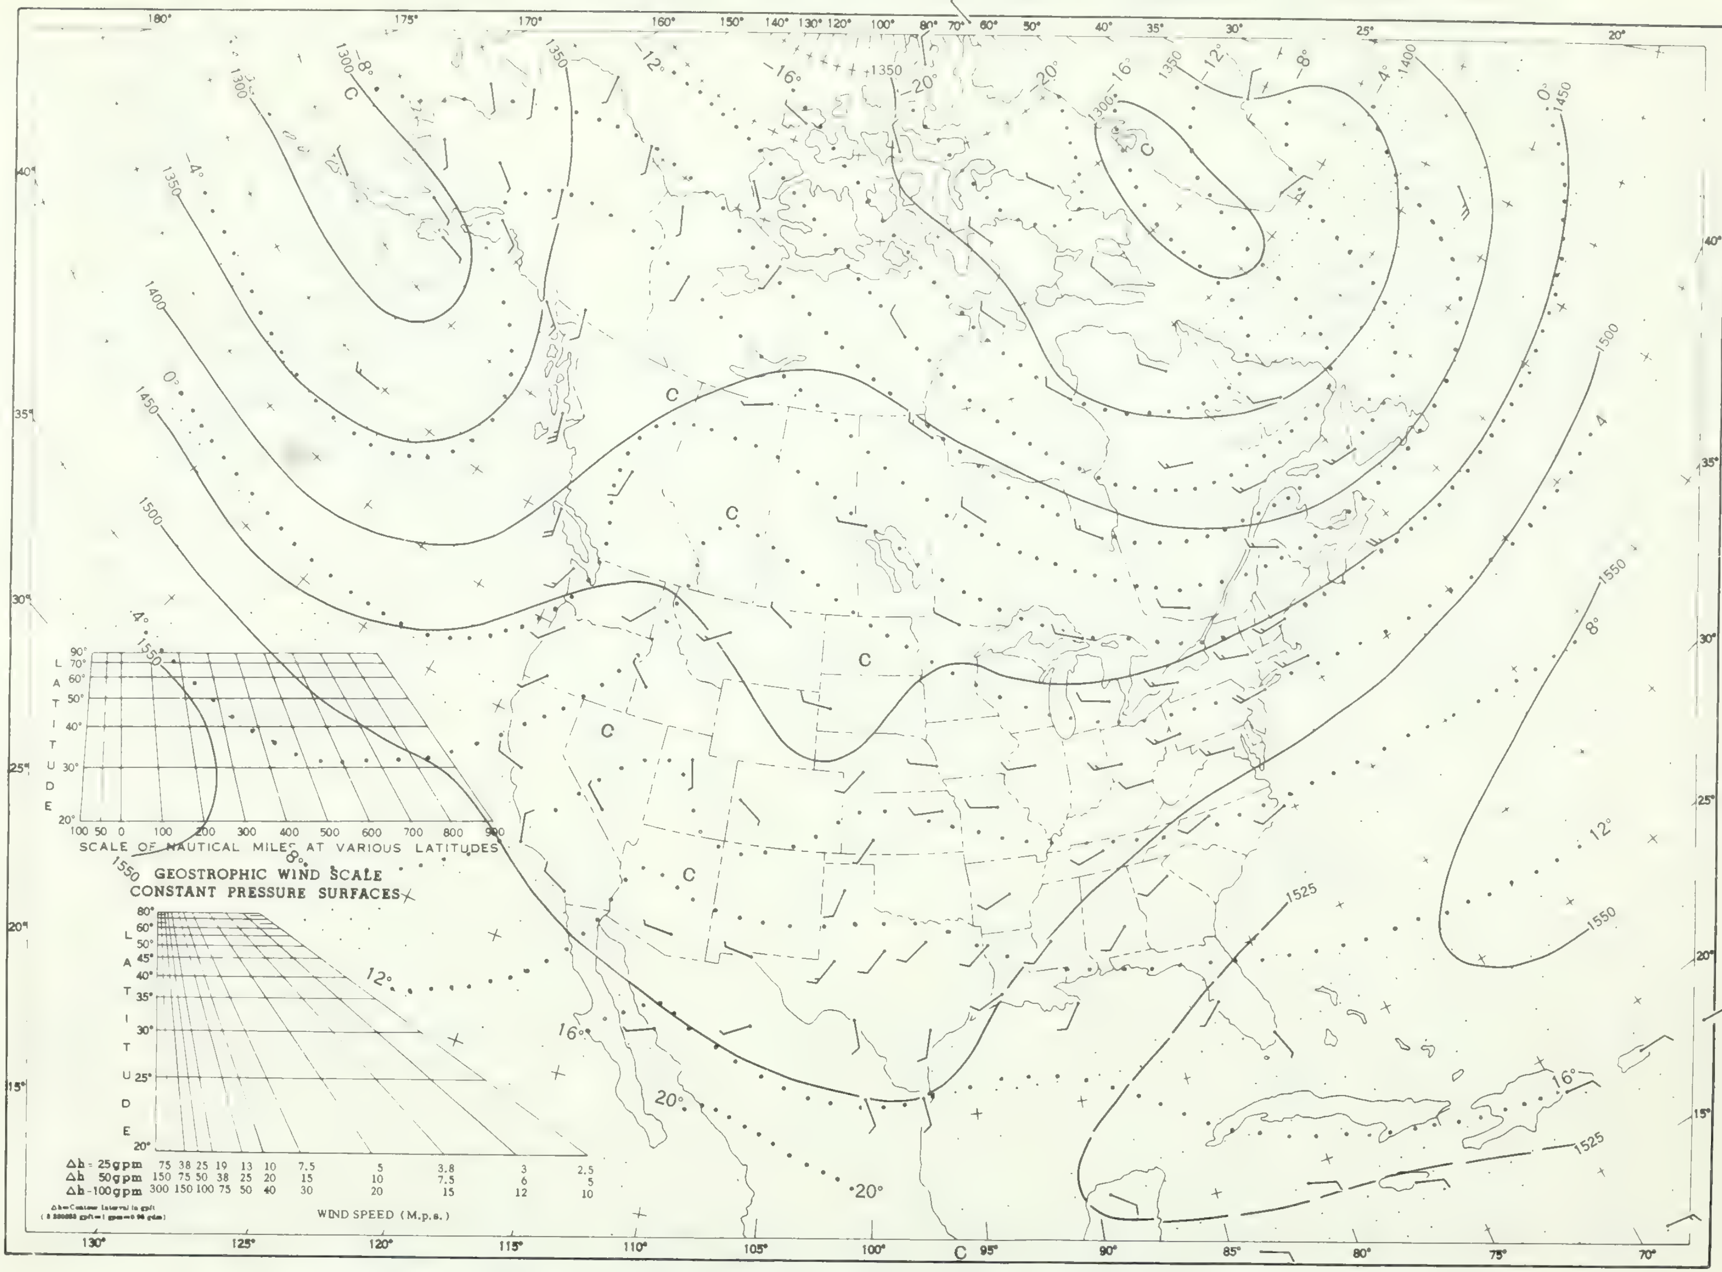
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, **April 1969**. Inset. Departure of Average Pressure (mb) from Normal, **April 1969**.



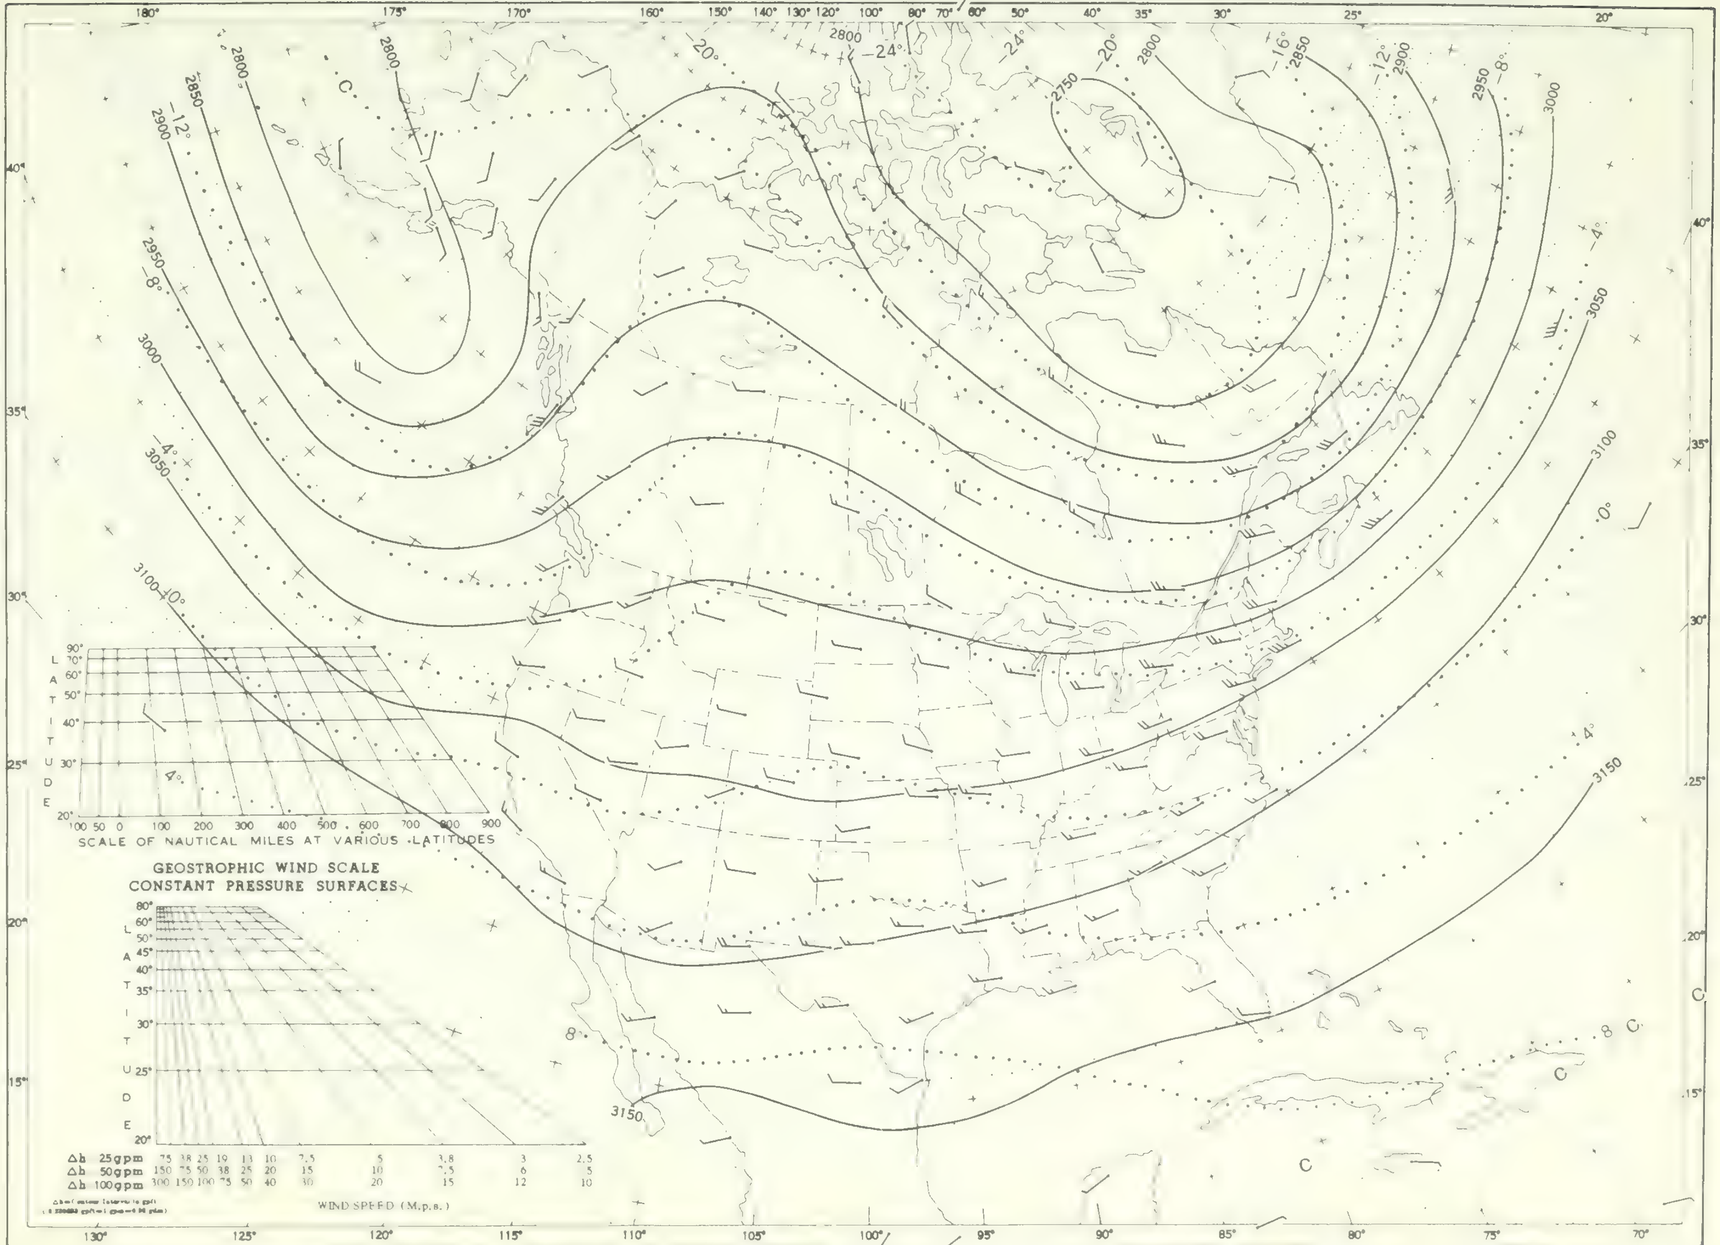
Average sea level pressures are obtained from eight daily 3 hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI 850-mb Surface, 1200 GMT, April 1969. Average Height and Temperature, and Resultant Winds.



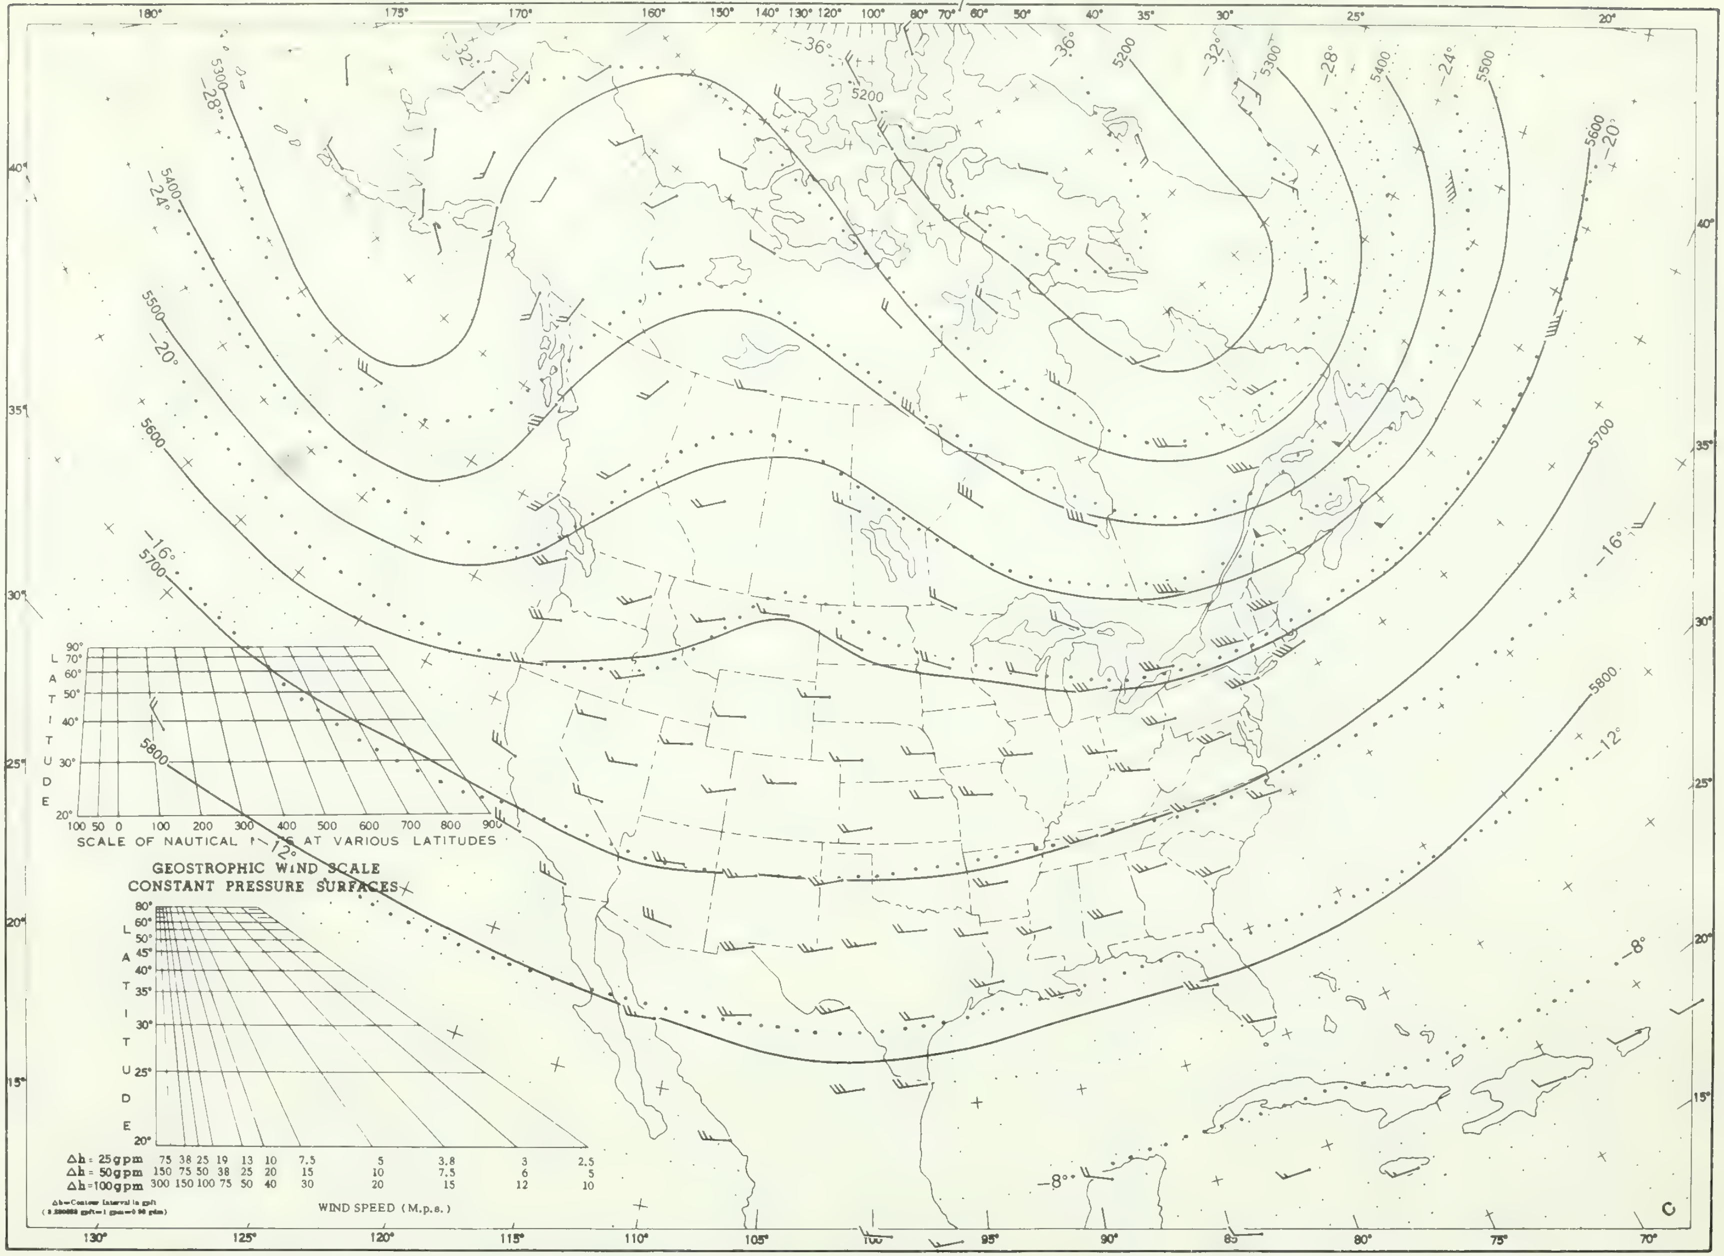
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, April 1969. Average Height and Temperature, and Resultant Winds.



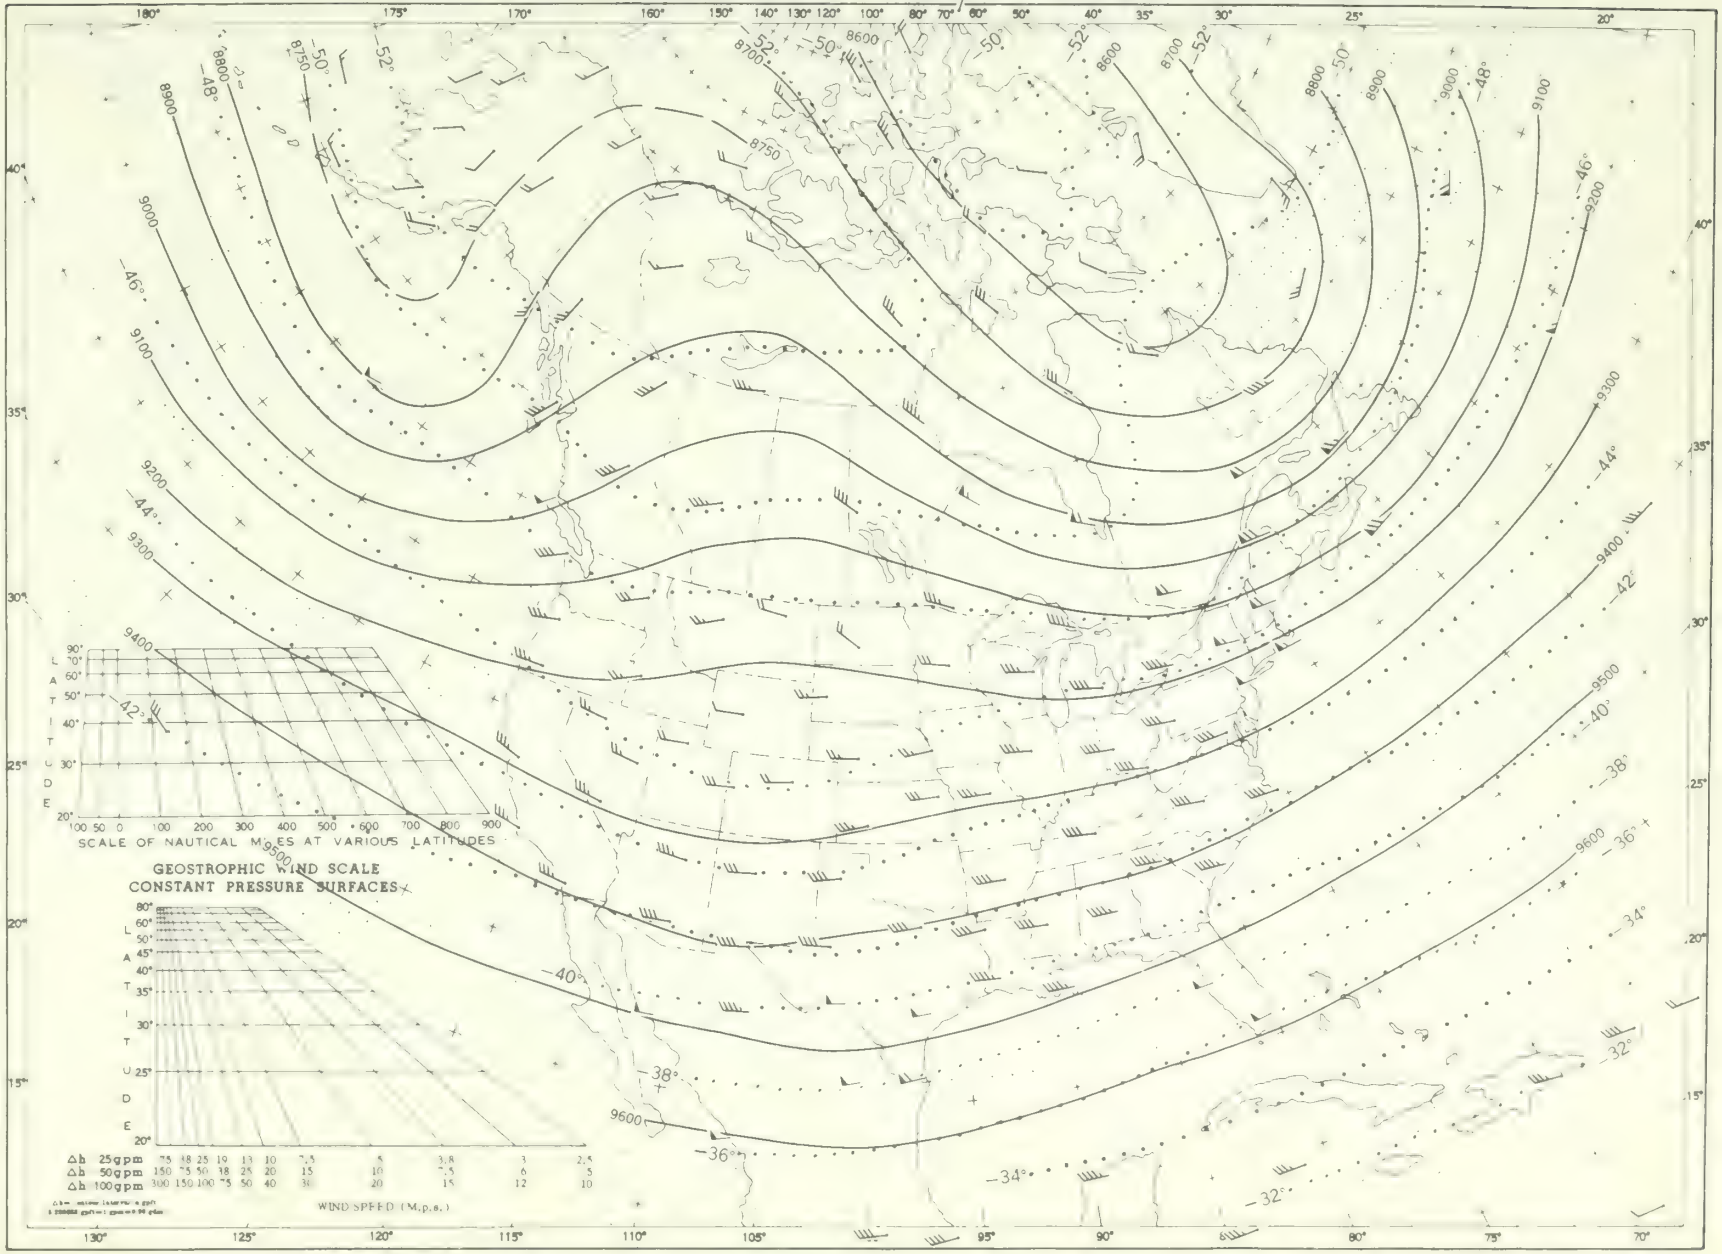
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 GMT, April 1969. Average Height and Temperature, and Resultant Winds.



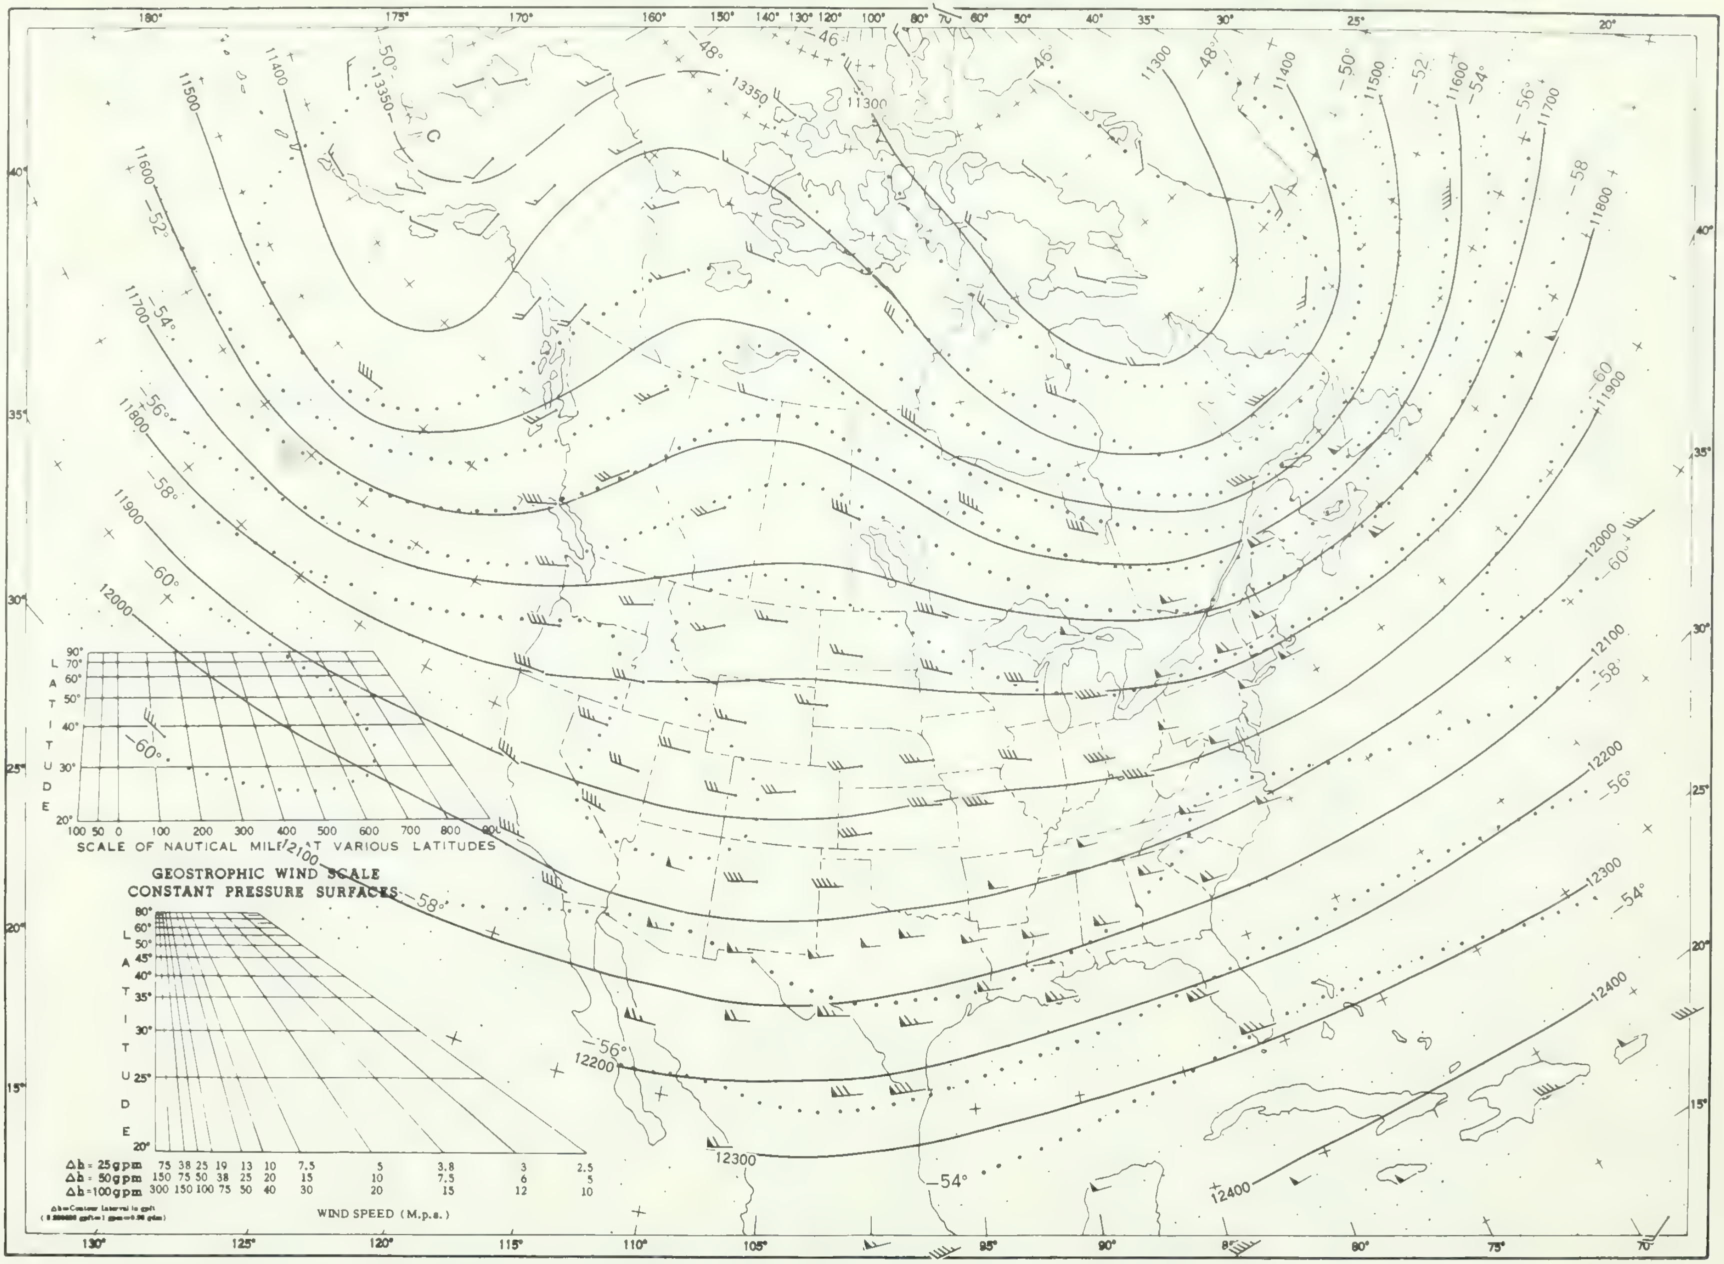
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 GMT, April 1969. Average Height and Temperature, and Resultant Winds



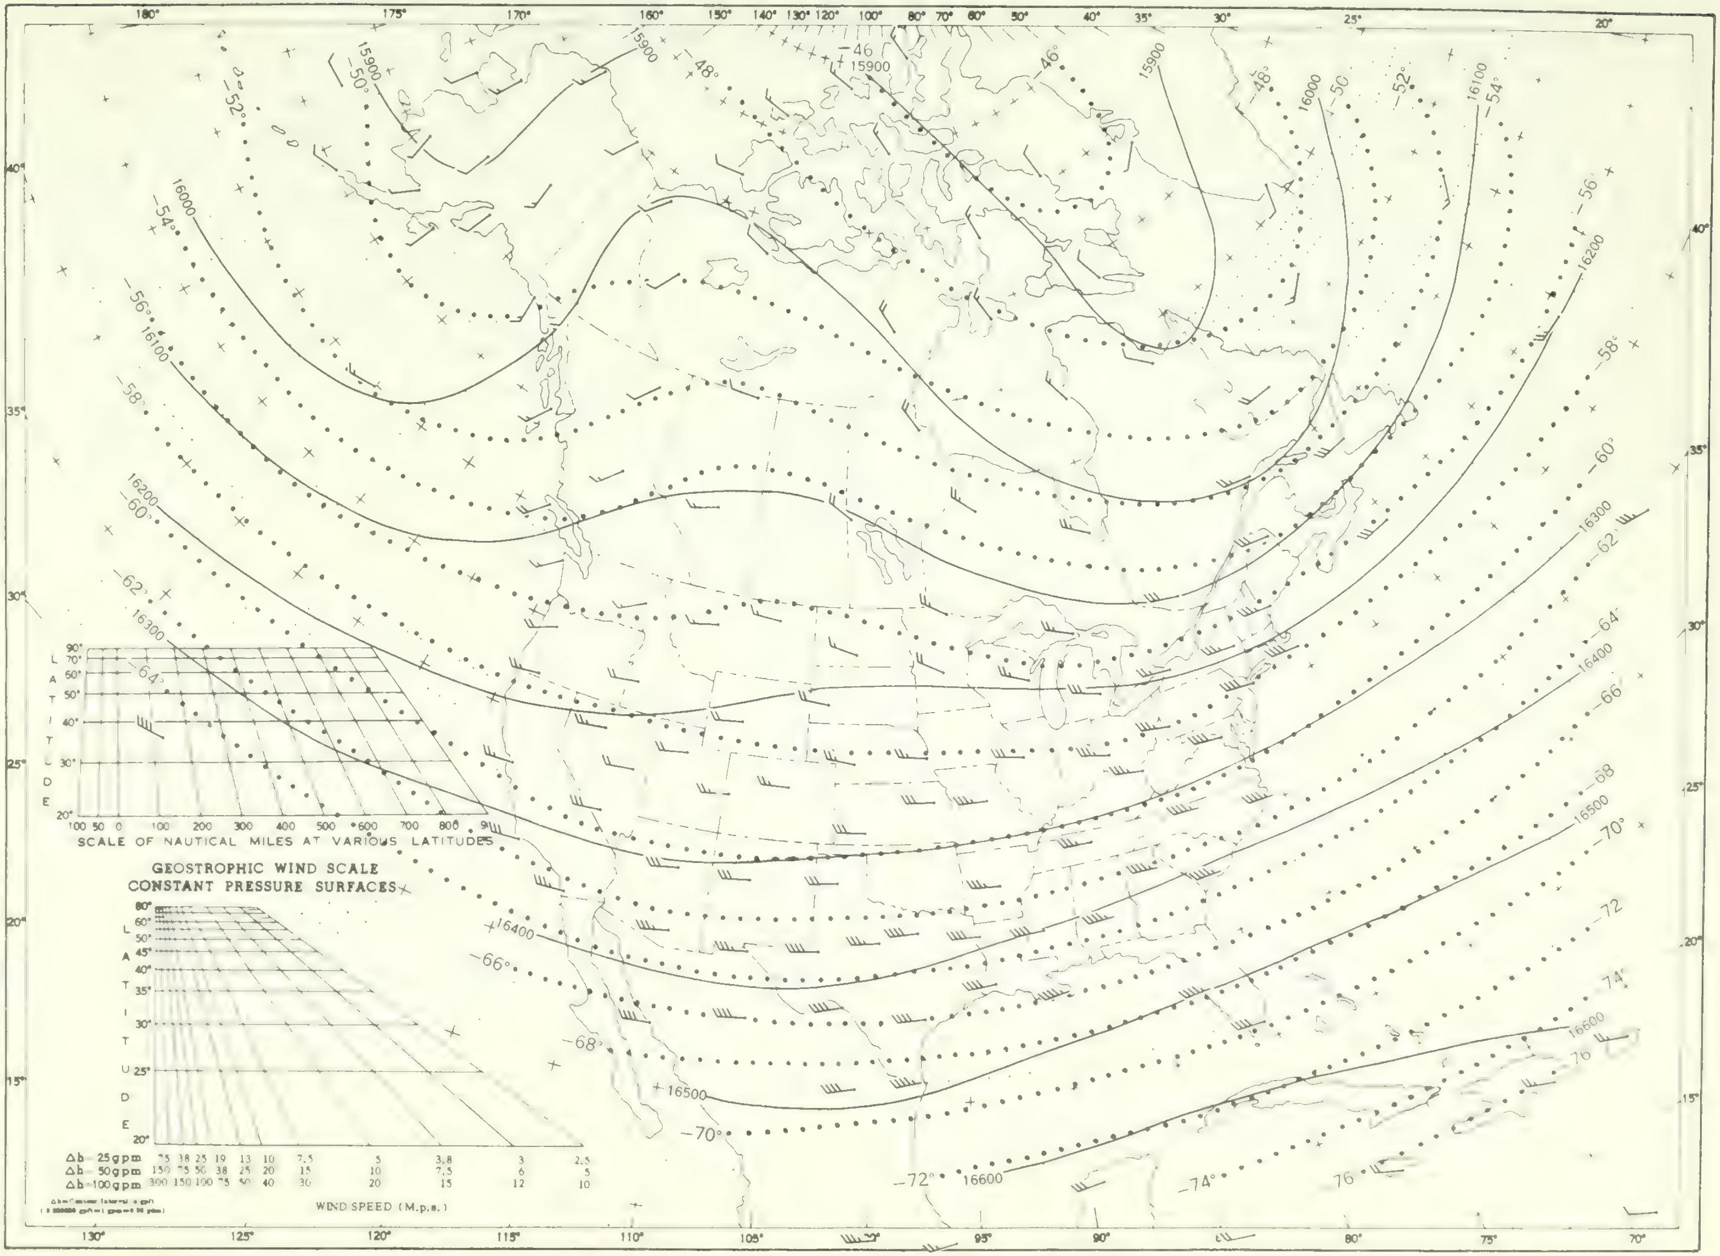
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV. 200-mb. Surface, 1200 GMT, April 1969. Average Height and Temperature, and Resultant Winds



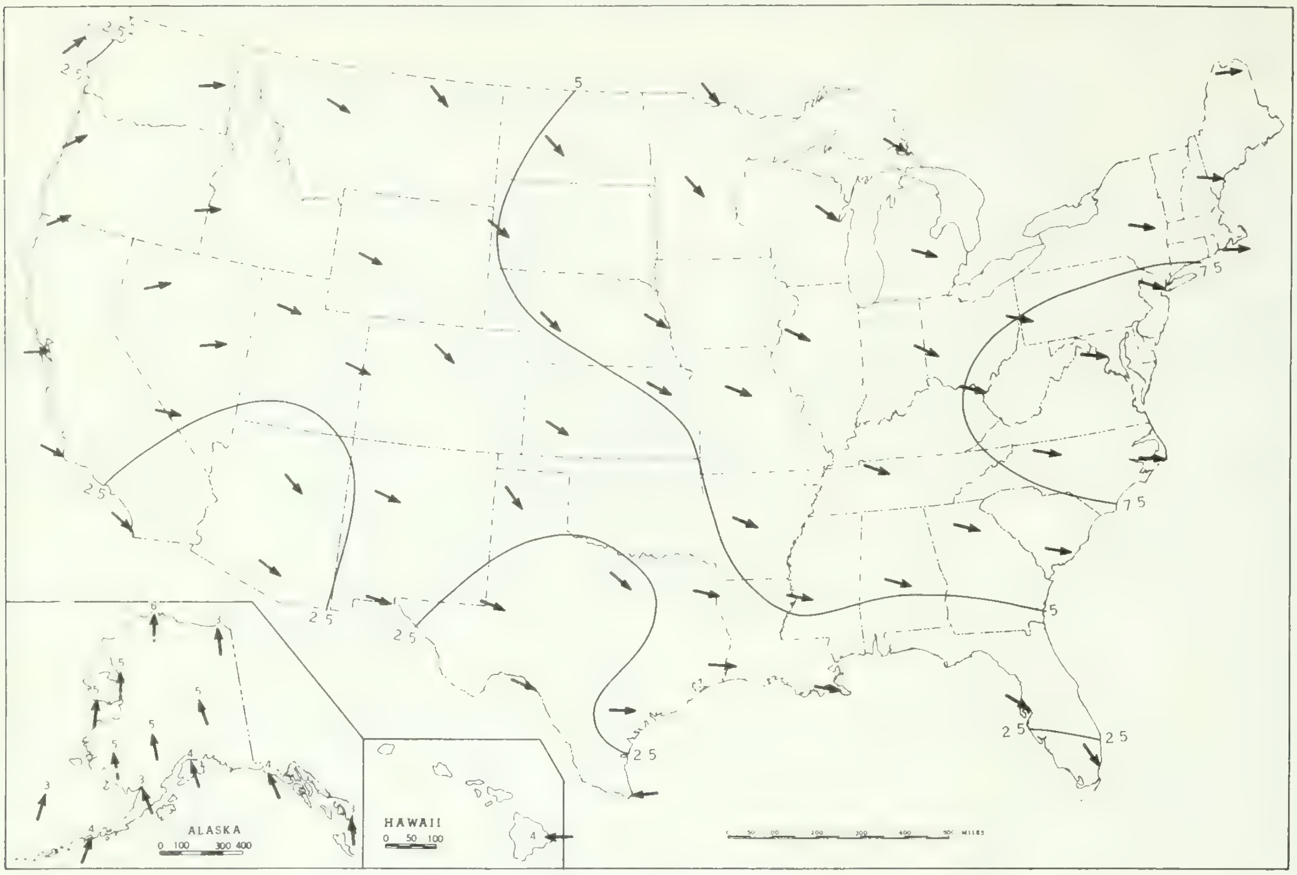
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 GMT, April 1969. Average Height and Temperature, and Resultant Winds.

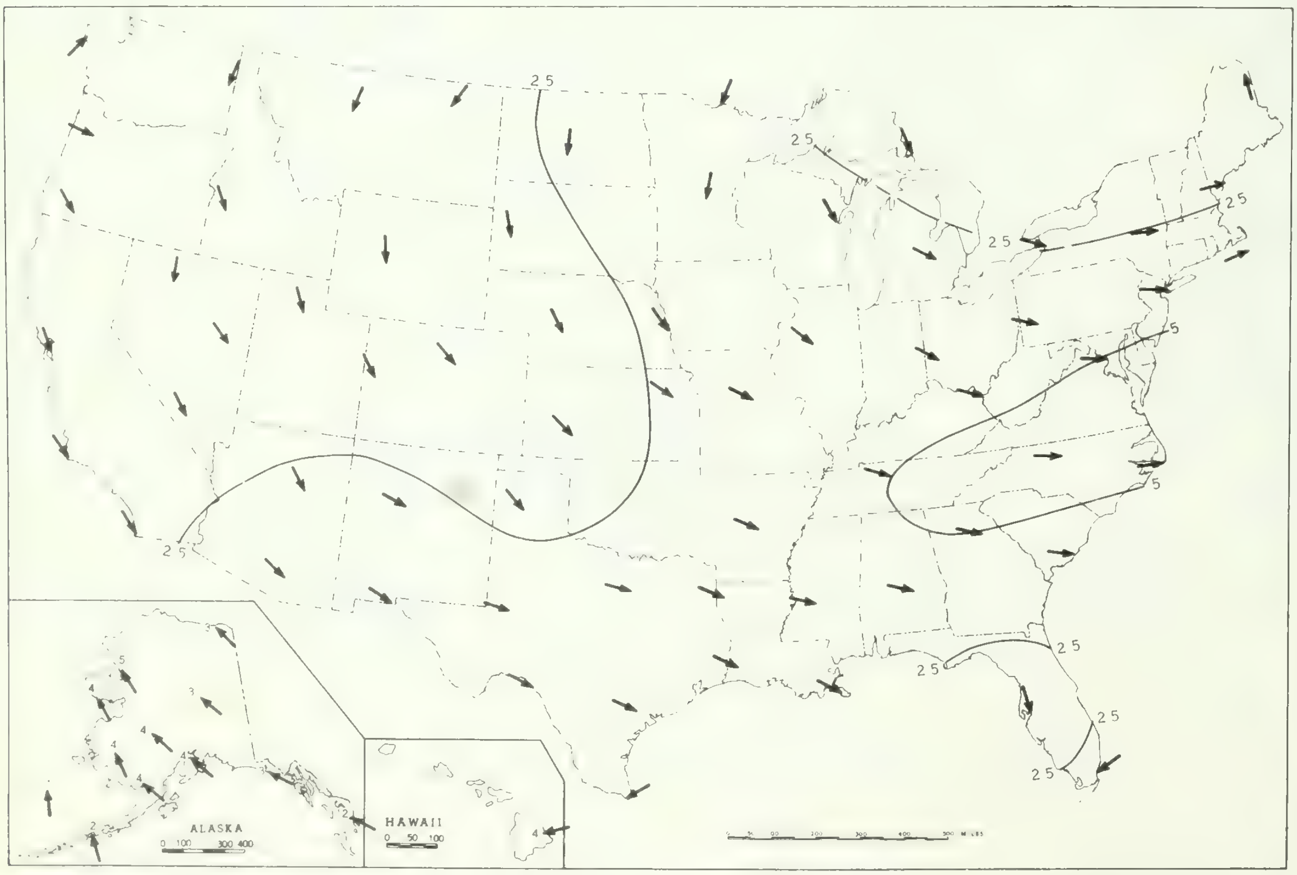


Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 GMT, April 1969. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, April 1969. Resultant Winds.



Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

C O N T E N T S

NOTE: Delayed data and corrections will be carried in the June and December issues of this publication. An explanatory page "Description of Charts" will be carried in the January and July issues.

SUBSCRIPTION PRICE: Monthly 20 cents and annual 40 cents per copy; yearly subscription, including monthly and annual issues, $2.50 domestic, $3.50 foreign. Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to "Superintendent of Documents, Government Printing Office, Washington, D.C. 20402"

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 20 No. 5 MAY 1969

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:
1. Temperatures fluctuated considerably but averaged slightly warmer than normal over most of the Nation.
2. Precipitation over most areas ranged from 50% to 150% of normal. Some southwestern desert areas received more than twice their normals.
3. Tornado occurrences were about average, 144, but they caused only 4 deaths. The 16-year average for May is 34 deaths from tornadoes.

TEMPERATURE.--Temperatures in May averaged slightly below normal from the Great Lakes to New England and over the Southland from Texas to Virginia and Florida. Near to above normal temperatures predominated over most of the rest of the Nation. Warm temperatures persisted over most of the western half of the Nation during the entire month, and much of the Great Basin averaged 3° to 7° warmer than normal. Eastern areas were especially warm in the second and last weeks of May.

May began with cool temperatures over much of the East. Light frost occurred from Michigan to New England and southward to West Virginia with record-low temperatures in West Virginia and surrounding areas. Warming in the central Great Plains pushed maximums in western Kansas to the middle 80's. Another batch of cold air moved into the Pacific Northwest during the first week of May and cooled the northern States as far eastward as Minnesota. By the end of the week, warm weather again predominated over the Pacific Northwest as temperatures tumbled sharply over the Central and East. The southern Rockies cooled to far below normal. Douglas, Ariz., registered 32° on the morning of May 7.

By midmonth, the southwestern deserts had warmed to 100° or higher. Blythe, Calif., registered 103° on the 13th. In contrast to the warming trend over the West and Central, a deep northwesterly current cooled the East. Frost occurred in the northern and central Appalachians on 1 or 2 mornings. The temperature at Bristol, Tenn., on May 13 was 32°. On the 15th and 16th, cold air spilled into the northern Great Plains holding afternoon temperatures in the 50's; maximums had reached the 80's and 90's in this region a few days earlier. The warm air spread eastward, reaching the Northeast by the 17th, when Boston, Mass., registered 87°.

The warming trend continued west of the Rockies in the 4th week of May, with 90° readings common as far north as Seattle, Wash., and with readings above 100° in the southwestern deserts almost every day. Parts of the Great Basin averaged 7° above normal during the 4th week. Cold air pushed southward east of the Rockies. Frost damaged strawberries in Minnesota. The winter chill extended from the western Great Lakes to New England.

In the last few days of May, a southerly current warmed the West as far north as the Canadian border. The warm air moved eastward with Pierre, S. Dak., registering 105° on the 28th and Marquette, Mich., recording 100° on the 29th. On the 31st, cooler air from the Pacific Northwest was lowering temperatures in Montana and Wyoming.

PRECIPITATION.--May began with widespread showers over the Upper Mississippi River Valley and with tornadoes and hailstorms dotting the southern Great Plains. Numerous hailstorms and 27 tornadoes occurred in Texas in the 1st week of May. Hail as large as baseballs pelted the southern part of the State. Seven-inch rains caused major flooding in the Upper Trinity and Upper Brazos River Basins in north-central Texas. Four persons were drowned and property damage was estimated to exceed $5 million.

Rain began on the eastern slopes of the Colorado Rockies late on the 4th and continued until the morning of the 8th. Storm totals exceed 10 inches over most of the area from Estes Park to about 25 miles southwest of Denver and 12 inches in some localities. Heavy snow fell in the higher Rockies and, later in the period, in the lower mountain areas. Numerous rock and land slides occurred in the mountains and severe flooding occurred along the South Platte River. The rock and land slides blocked roads and disrupted communications, isolating some communities. Local flooding continued along the South Platte River until the crest reached the State line on the 12th.

Rain fell in 39 States on May 7 and tornadoes struck Illinois, Indiana, Ohio, Kentucky, and Mississippi on the 8th and 10th.

In the early evening of May 8, a tornado in the Tappan Lake, Ohio, area topped 20 trees, damaged dwellings, destroyed homes, killed 1 person and injured 21 others. Another tornado in Ohio injured 26 persons on the 10th. More heavy thundershowers drenched the southern Great Plains at midmonth and twisters hit scattered localities from Texas to Wisconsin and in the Ohio River Valley. Most of these tornadoes caused only light property damage. Violent weather struck the central Great Plains late in May with tornadoes in Kansas and hail in Minnesota.

Only light rains occurred in the Great Basin in May. The inch that fell at Las Vegas, Nev., is 10 times their normal. Many desert areas received several times their May normals.

Precipitation averaged above normal over most of Washington and Oregon, near normal over the northern and central Great Plains and eastward to the Atlantic Ocean, and above normal over north-central Texas, western Louisiana, and Alabama. The pattern was especially uneven in parts of Mississippi and Alabama. Jackson, Miss., received only about 1/3 of the normal May rain, but Birmingham, Ala., received more than 3 times the normal. Tampa, Fla., received more than twice the May normal, while nearby Orlando had less than half the normal for that location.

Among the interesting statistics for May are:

Red Bluff, Calif.: First May in 41 years and second in 94 years with no rain.

Roswell, N. Mex.: Least May rainfall, 0.10 inch, in 24 years.

Birmingham, Ala.: Most May rainfall, 11.10 inches, in 77 years.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

C Crop damage
° Includes crop damage

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
\# Freezing drizzle and freezing rain, commonly known as glaze.
ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, ESSA, monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000
7 $5,000,000 to $50,000,000
8 $50,000,000 to $500,000,000
9 $500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

MAY 1969

Elmer R. Nelson, Office of Hydrology

The most significant flooding during May was the receding snowmelt floods in the Red River of the North Basin, the Upper Mississippi Basin, and the Missouri Basin. All streams were back within their banks at the end of May, except the Souris River near Bantry and Westhope, N. Dak., and the James River at Columbia and Stratford, S. Dak.

A special report on the record to near record snowmelt floods was included in the April issue of this publication.

HUDSON BAY DRAINAGE

Red River of the North Basin.--The Sheyenne River at West Fargo, N. Dak., receded within its banks on May 6. The Souris River near Bantry and Westhope, N. Dak., continued in flood into June. A record crest occurred near Bantry, N. Dak., on May 4. The Red River of the North at Drayton and Pembina, N. Dak., continued in flood to May 15.

ST. LAWRENCE DRAINAGE

Lake Erie.--Heavy rains over northeastern Ohio on May 17-18 caused flash floods on the Chagrin River in the Cleveland, Ohio, area. The river crested at Willoughby, Ohio, at a stage of 16.83 ft. at 4:00 a.m. on the 19th, 0.1 ft. above the Jan. 1959 flood. The Cuyahoga River at Independence, Ohio, crested at a stage of 17.5 ft. early on the 19th. This was 1.5 ft. above bankfull stage. The storm rainfall causing this overflow averaged about 4 inches. Moderate to heavy property damage resulted.

Minor flooding occurred on the Sandusky River in Ohio on the 19th-21st from rainfall averaging 3.2 inches. Damage was light.

Rainfall on May 7-14, caused local flooding in western New York. The only report of serious flooding was along Tannery Brook in East Aurora, N. Y. Two feet of water covered sections of Main Street.

ATLANTIC SLOPE DRAINAGE

A major flood occurred on the St. John River at Fort Kent, Maine, on May 11. The crest of 25.36 ft. was slightly lower than the record crest of 25.8 ft. recorded in May 1961. Minor flooding occurred on other streams in Maine. Melting snow in northern Maine and along the Canadian border plus an inch of rain in 24 hours caused the rapid rise on the St. John. The flood damage at Fort Kent was estimated at $300,000. No injuries occurred, but 12 families were evacuated, 65 partially evacuated, 120 residences and stores had water in basements, and many streets and roads were flooded. Damage on the Upper Ammonoosuc at Groveton, N. H., was estimated at $400,000. Minor flooding on the Connecticut River at Hartford and Bodkin Rock, Conn., continued from Apr. 11 to May 2-3.

Flash flooding and landslides occurred on Pine Creek, Lymans Run and Little Kettle Creek in the vicinity of Galeton, Pa., from heavy rain on the evening of May 19. Gaines, Pa., reported 5.27 inches and Carter Camp, Pa., 4.93 inches. Damage was estimated to be confined to highways and swinging bridges as well as to a number of camps.

The Lumber River at Lumberton, N. C., receded within its banks on May 5, after being out of its banks 103 days.

The Santee River at Jamestown, S. C., receded within its banks on May 3 after cresting 7 ft. above flood stage on Apr. 27. Some swampland flooding occurred from Jamestown, S. C., to the coast for several days thereafter. Damage was limited to swamplands and lowlands along the river.

The Edisto River at Givhans Ferry, S. C., crested nearly 3 ft. above flood stage on the 26th. Approach roads to resort areas and campsites were inundated.

The Savannah River at Clyo, Ga., receded within its banks on May 29. Damage was estimated to be moderate and light to moderate upstream at Millhaven-Wade, Ga. Light flooding occurred on the Ogeechee River at Dover and Eden, Ga., during the latter part of the month.

Light flooding occurred on the Altamaha River at Charlotte, Ga., in the beginning of the month. The Satilla River near Atkinson, Ga., crested nearly 2 ft. above flood stage on May 31.

EAST GULF OF MEXICO DRAINAGE

Minor flooding occurred on the Apalachicola River at Blountstown, Fla., on the 21st-24th. The damage was estimated at $12,900.

General rains on the 15-20th caused minor flooding on the Choctawatchee and Cahaba Rivers in Alabama and Florida. Damage was negligible and the overflow was confined to woodlands and pasturelands.

Heavy rains on the 17th and 18th caused light overflows on the Black Warrior River in Alabama. Warnings were timely and no damage was reported. The Tombigbee River receded within its banks at Jackson, Ala., on May 3.

Flooding on the lower reaches of the Pearl River during the first week of May was confined to farms and timberlands in the immediate flood plain. Timber cutting operations were suspended until flooding subsided.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--The snowmelt flood of 1969 continued into May with several locations along the Mississippi and Minnesota Rivers remaining above flood level until the middle of May.

The average river stages and flows for the Mississippi River, the St. Croix, and the Minnesota Rivers for May 1969 were the highest since May 1965. The average stage of the Minnesota River at Mankato, Minn., was the third highest of record. At St. Paul, Minn., the average stage of the Mississippi River was the 4th highest of record.

Flash flooding occurred along Black Hawk Creek at Hudson, Iowa, on the 3d and 4th from heavy local rains on the 2d and 3d. The North River at Norwalk, Iowa, exceeded flood stage by 4.7 ft. on the 22d. No damage resulted.

Missouri Basin.--Snowmelt runoff and some rain caused flooding on the Big Hole River at Divide and Melrose, Mont., on the 20th-24th. No damage was reported.

Locally heavy rains and snow along the eastern slope of the mountains in Colorado caused some flooding along tributaries of the South Platte River. Highway 295 above Morrison, Colo., on Turkey Creek was damaged.

One to 2-inch rains on the 22d over the eastern half of northern Kansas and southeast Nebraska caused minor overflows on tributary streams in the Kansas River Basin. Except for heavier overflow on Bow Creek in the Smoky Hill River Basin, damages were negligible from the light overflows.

Frequent heavy showers caused minor flooding on tributary streams in northern Missouri. These showers

caused rapid rises but flood stages were generally not reached until the last decade of the month. Some flash flooding occurred along minor streams.

Some light overflow occurred along the main stem of the Missouri River in the reach from Rulo, Nebr., to Lexington, Mo.

Ohio Basin.--Flash flooding occurred on Loyalhanna Creek in the Ligonier, Pa., area on the 20th. Unofficial rainfall amounts of 3.76 inches resulted in the washout of a temporary bridge across Loyalhanna Creek, disrupting traffic on Route 711. Several basements were flooded.

Rainfall averaging 3.2 inches on the 18th and 19th caused extensive flooding on the Scioto River in the reach from La Rue to Circleville, Ohio. Some secondary roads near Prospect, Ohio, and between Columbus and Circleville, Ohio, were under water for 3 to 4 days. A limited acreage of corn planted in the lowlands required replanting. Several families in the Wonderland addition of Columbus, Ohio, were evacuated for a few hours during the night of the 19th.

More than 2 inches of rain on the 18th and 19th caused light flooding on the Muscatatuck River at Austin, Ind. No damage resulted.

Heavy rain on the 17th and 18th caused a rapid rise on the Saline River at Harrisburg, Ill., to nearly 12 ft. above flood stage on the 20th. Flooding was confined to farm ground with some damage to growing crops.

Minor flooding occurred on the Tennessee River at Whitesburg, Ala., on May 20.

The Ohio River at Cairo, Ill., continued in flood from Apr. 14 to May 1. Flooding was confined to low farm ground with little or no damage.

White Basin.--The Cache River at Patterson, Ark., receded within its banks on May 8 and the White River at St. Charles and Clarendon, Ark., on May 9-11. No appreciable damage resulted from the flooding.

Arkansas Basin.--Some brief light flooding occurred on the Cottonwood and Little Arkansas Rivers in Kansas from local 2-inch rains on the 22d. Light to moderate flooding occurred on the Walnut River in the vicinity of and above Augusta, Kans.

Flash floods occurred along Cottonwood Creek south of Guthrie, Okla., and on the San Bois Creek west of Keoto, Okla., on May 7. The Cimarron River near Dover, Okla., crested 0.9 ft. above flood stage on the 8th. Red Rock Creek, west of Red Rock, Okla., was out of its banks for a brief period on May 16. Heavy rain (3.45 inches) on May 30 caused the Little Caney River to rise rapidly above flood stage on May 31. It continued in flood to June 4.

Some damage occurred due to surface drainage problems in Oklahoma City, Okla., on May 4 and in numerous other cities on May 4-7. Numerous creeks and small tributaries were flooded for brief periods due to local heavy thunderstorms.

Minor lowland flooding occurred on the North Canadian from near El Reno to Yukon, Okla., on May 6-10 and on the Little River at Tecumseh, Okla., on May 6-7. Damage was mostly to farm crops along the bottomland areas.

Red Basin.--Heavy rains on May 3-4 caused flooding in Hobart, Okla., due to inadequate surface drainage and flash flooding of Frisco Creek. Damage was estimated at $116,000.

Minor lowland flooding occurred on tributary streams in Oklahoma due to scattered thunderstorms. Brief flooding occurred on the Salt Fork of the Red River near Mangum, Okla., on May 14. Slight flooding occurred on the North Fork of the Red near Headrick, Okla., on May 14-15.

Beaver Creek at Waurika, Okla., was slightly above flood stage on May 5-7. Fifteen families were evacuated. This flooding was due to 1- to 2-inch rains over Beaver and Cow Creeks.

Atchafalaya Basin.--The Atchafalaya River at Morgan City, La., was at or above flood stage on May 4-18.

WEST GULF OF MEXICO DRAINAGE

Light flooding occurred on the Mermentau River at Mermentau, La., on May 8-11 and on the Calcasieu River at Hineston and Oakdale, La., on May 8-14. No damages resulted from the overflows.

Most of the Sabine River in northeast Texas has been above flood stage since the middle of March, except for a 2-week period, the last of April and the first of May.

During March, April, and May, more than 20 inches of rain fell over most of the Meches Basin with more than 26 inches near Nacogdoches. This is the 3d consecutive month of flooding in the Neches Basin.

Major flooding occurred in the Trinity and Upper Brazos Basins during May. Flash flooding was extensive in and south of Cleburne, Tex., and in the communities of Kennedale and Everman, Tex. Flash flooding occurred along Village Creek to the south of Fort Worth and along Mountain Creek to the south of Grand Prairie, Tex., on the night of the 6th and the morning of the 7th. The Upper Trinity at Dallas and Trinidad, Tex., was the highest since 1957.

Preliminary estimates of flood damage in the Trinity and Upper Brazos Basins was placed at $4.6 million. Numerous homes were damaged by flood waters in Dallas and Cleburne, Tex. Several business establishments suffered damage in Dallas. Several homes were evacuated near Mountain Creek in the southeast portion of Grand Prairie on the night of the 6th. Village Creek in the south portion of Tarrant County overflowed on the night of the 6th and forced several families to briefly evacuate their homes in Kennedale and Everman. Three persons were drowned in Mustang Creek near Rio Vista, Tex., on the night of the 6th. A woman was drowned in the high waters in Mesquite when her car stalled on the night of the 6th. Dallas and Johnson Counties were declared disaster areas.

Flooding continued on the San Jacinto at Lake Houston, Tex., from Dec. 1 into June. The excessive rains which began on the 4th brought new rises on the Navasota River near Easterly, Tex.

Heavy rain on the 2d and 4th caused minor flooding on the Navidad and Lavaca Rivers in Texas. Flooding was restricted to the lowlands along the rivers.

Several days with locally heavy rains in the Lower Nueces Basin caused flash flooding in many areas. Rainfall amounts up to 6 inches were reported on the 12th at Papalotte in the Texas Coastal Bend drainage. Damages were limited to highway and soil erosion.

Great Basin.--The Carson River near Stewart, Nev., crested on May 25 with a flow of 4,304 c.f.s. Some 3,000 to 4,000 acres of grassland on the west side of the Valley was flooded. The only damage was a few weeks delay of grass growth. Another 2,000 to 3,000 acres of alfalfa and grainland was flooded about 20 miles below Dayton, Nev. The Truckee River in Reno, Nev., reached a peak flow of 5,412 c.f.s. on May 13.

PACIFIC SLOPE DRAINAGE

The Merced River at Sentinel Bridge, Calif., was above flood stage on May 22-24. Some flooding occurred in the meadows in Yosemite Valley.

The flooding in the normally dry Tulare Lake Basin in California increased during May from 78,500 acres on May 1 to 86,000 acres on June 2. The elevation of the lake on June 2 was 190.74 ft. compared to 177.0 ft. when the lake is dry.

Snowmelt caused the San Joaquin River to rise above the danger level at Vernalis, Calif., on May 18 and continue above this level until the end of the month.

High tides continued to plague the Sacramento-San Joaquin Delta at various points during May. These high tides required speed restrictions on all boat traffic through the delta and temporarily interrupted all navigation. Pumping continued at Sherman Island with more than half the island still under water at the end of the month. The dry portion was being prepared for crops.

Light flooding occurred on the Big Wood River at Hailey, Idaho, on May 10-14. Damage was light.

Near-record warm weather in the Columbia Basin on May 5-13 produced above-average snowmelt runoff. Inflow to Grand Coulee reservoir rose from 205,000 c.f.s. on May 1 to 340,000 c.f.s. on May 25. The Upper Columbia and Lower Snake River rises plus tributary stream runoff caused the Lower Columbia at Vancouver, Wash., to rise above flood stage on the 13th and continue in flood to the 28th. The crest on the 16th was 1 ft. above flood stage. The Corps of Engineers estimated the flood damage at $83,000.

the average monthly station pressures for the month of record, corrected to the height of the

refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages

speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degr

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G. C. T.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the

bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun.

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

U Indicates Urban sites.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys. MAY 1969

Station	Day of month

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska

MAY 1969

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	145	243	56	125	33	140	47	109	174	144	145	103	131	209	127	170	243	230	243	110	88	194	237	244	268	229	126	233	252	207	146	166

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer, Exp. Station. The instrument with which they were measured has not been checked by the ESSA, Weather Bureau.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (< 3900 Å) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	9.23	9.35	17.76	16.93	15.03	18.11	6.63	16.45	20.36	16.81	18.23	23.56	22.49	22.85	20.60	11.60	7.81	12.78	7.81	20.72	3.90	20.00	11.72	23.44	20.83	12.55	20.72	20.60	19.29	22.49	16.33	16.35

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the ESSA, Weather Bureau.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code [illegible] defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units Milli-atmo-cms.

Station	Day of month																														
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean [illegible]
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical [illegible] extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of [illegible] is expressed in terms of the thickness of a layer it would occupy at standard temperature and pressure, e.g. [illegible] The code [illegible] the type of measurement made.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), May.

B. Temperature Departure from 30 - Year Mean (°F 1931-60), May 1969.

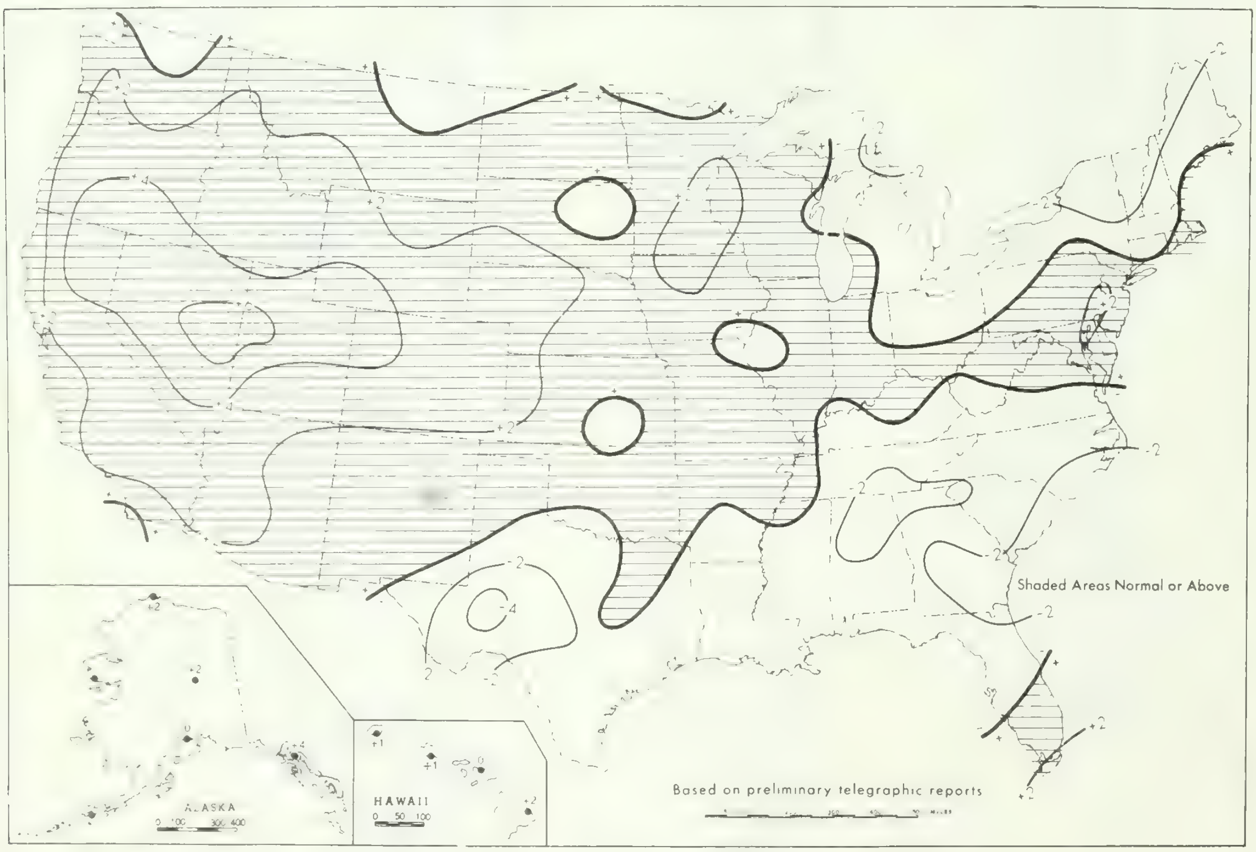

Chart II. Total Precipitation (Inches), May 1969.

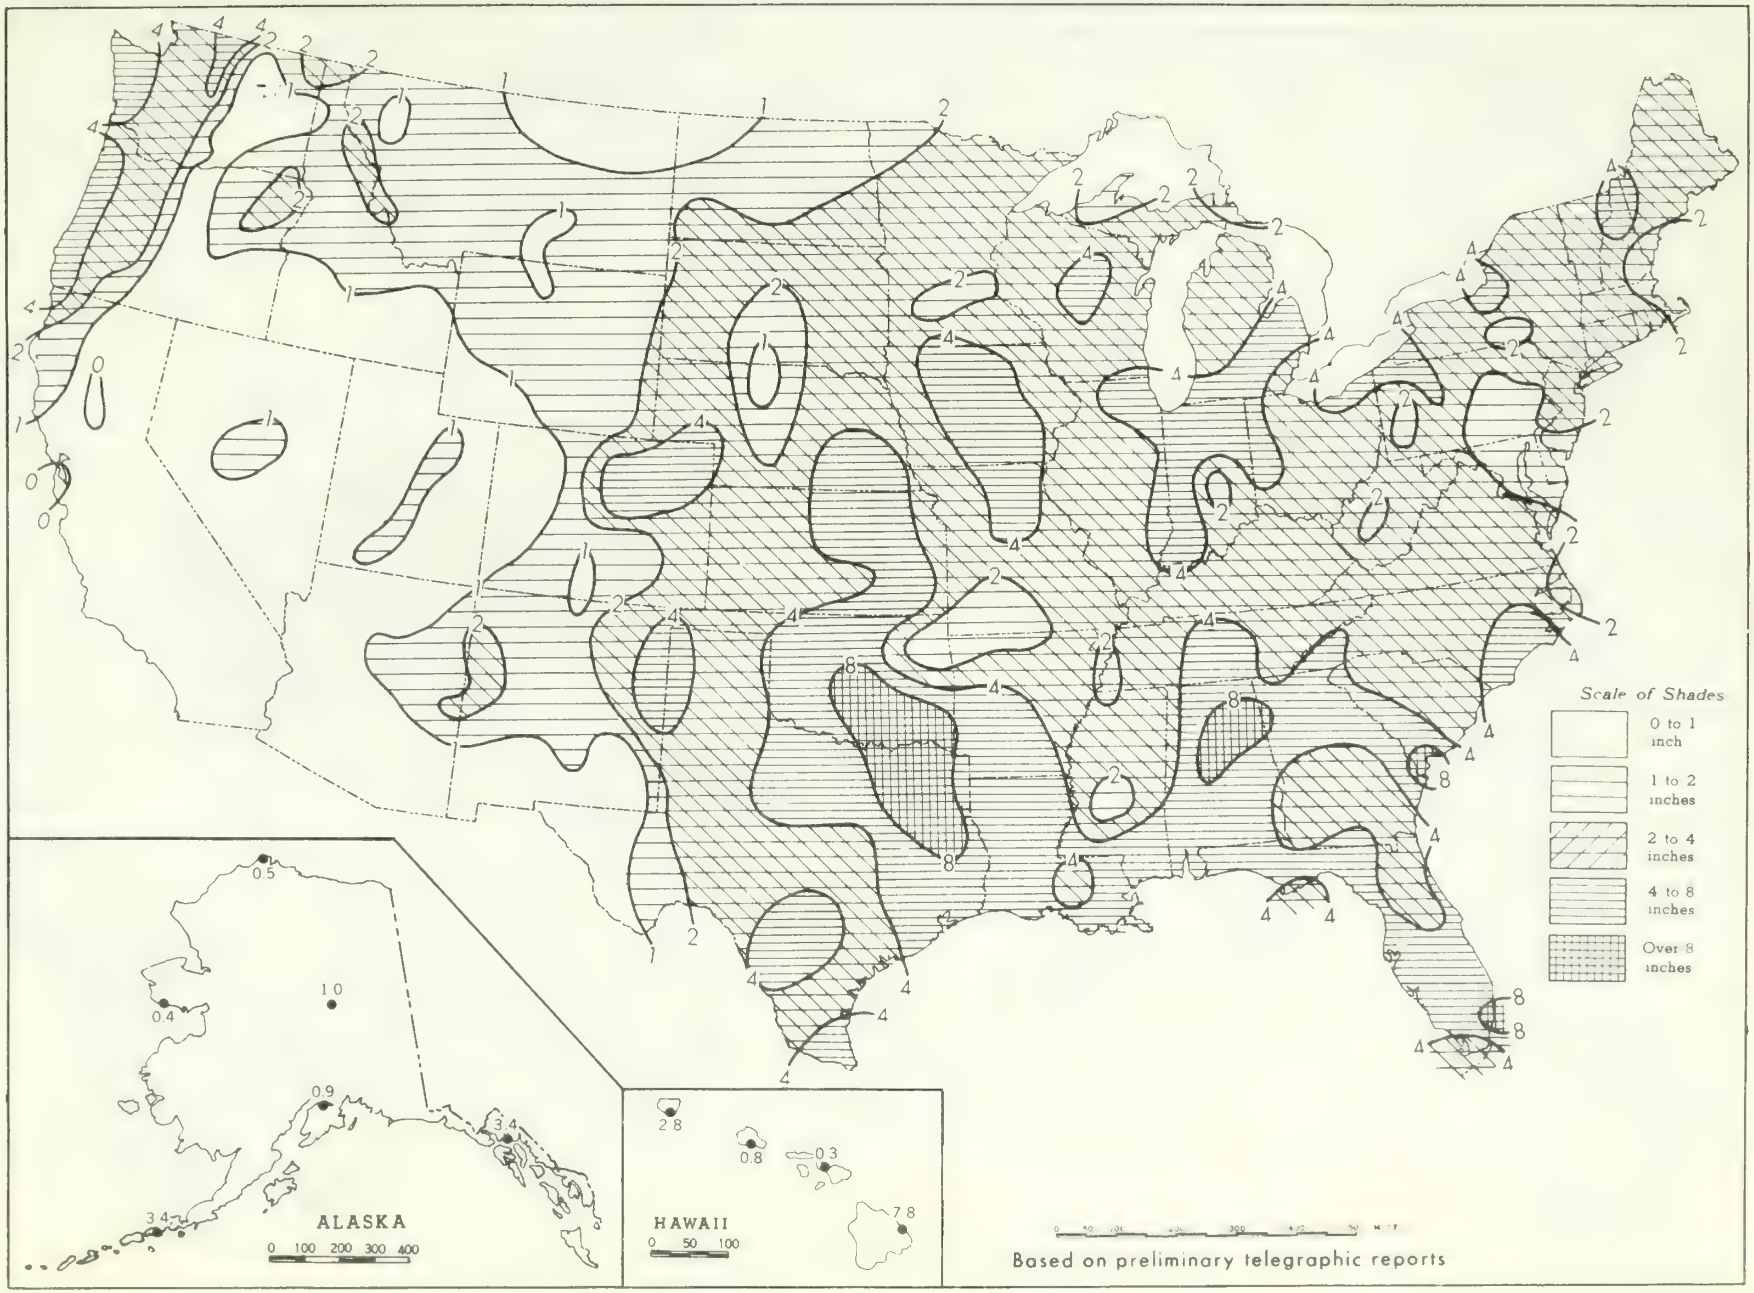

Chart III. Percentage of Normal Precipitation, May 1969.

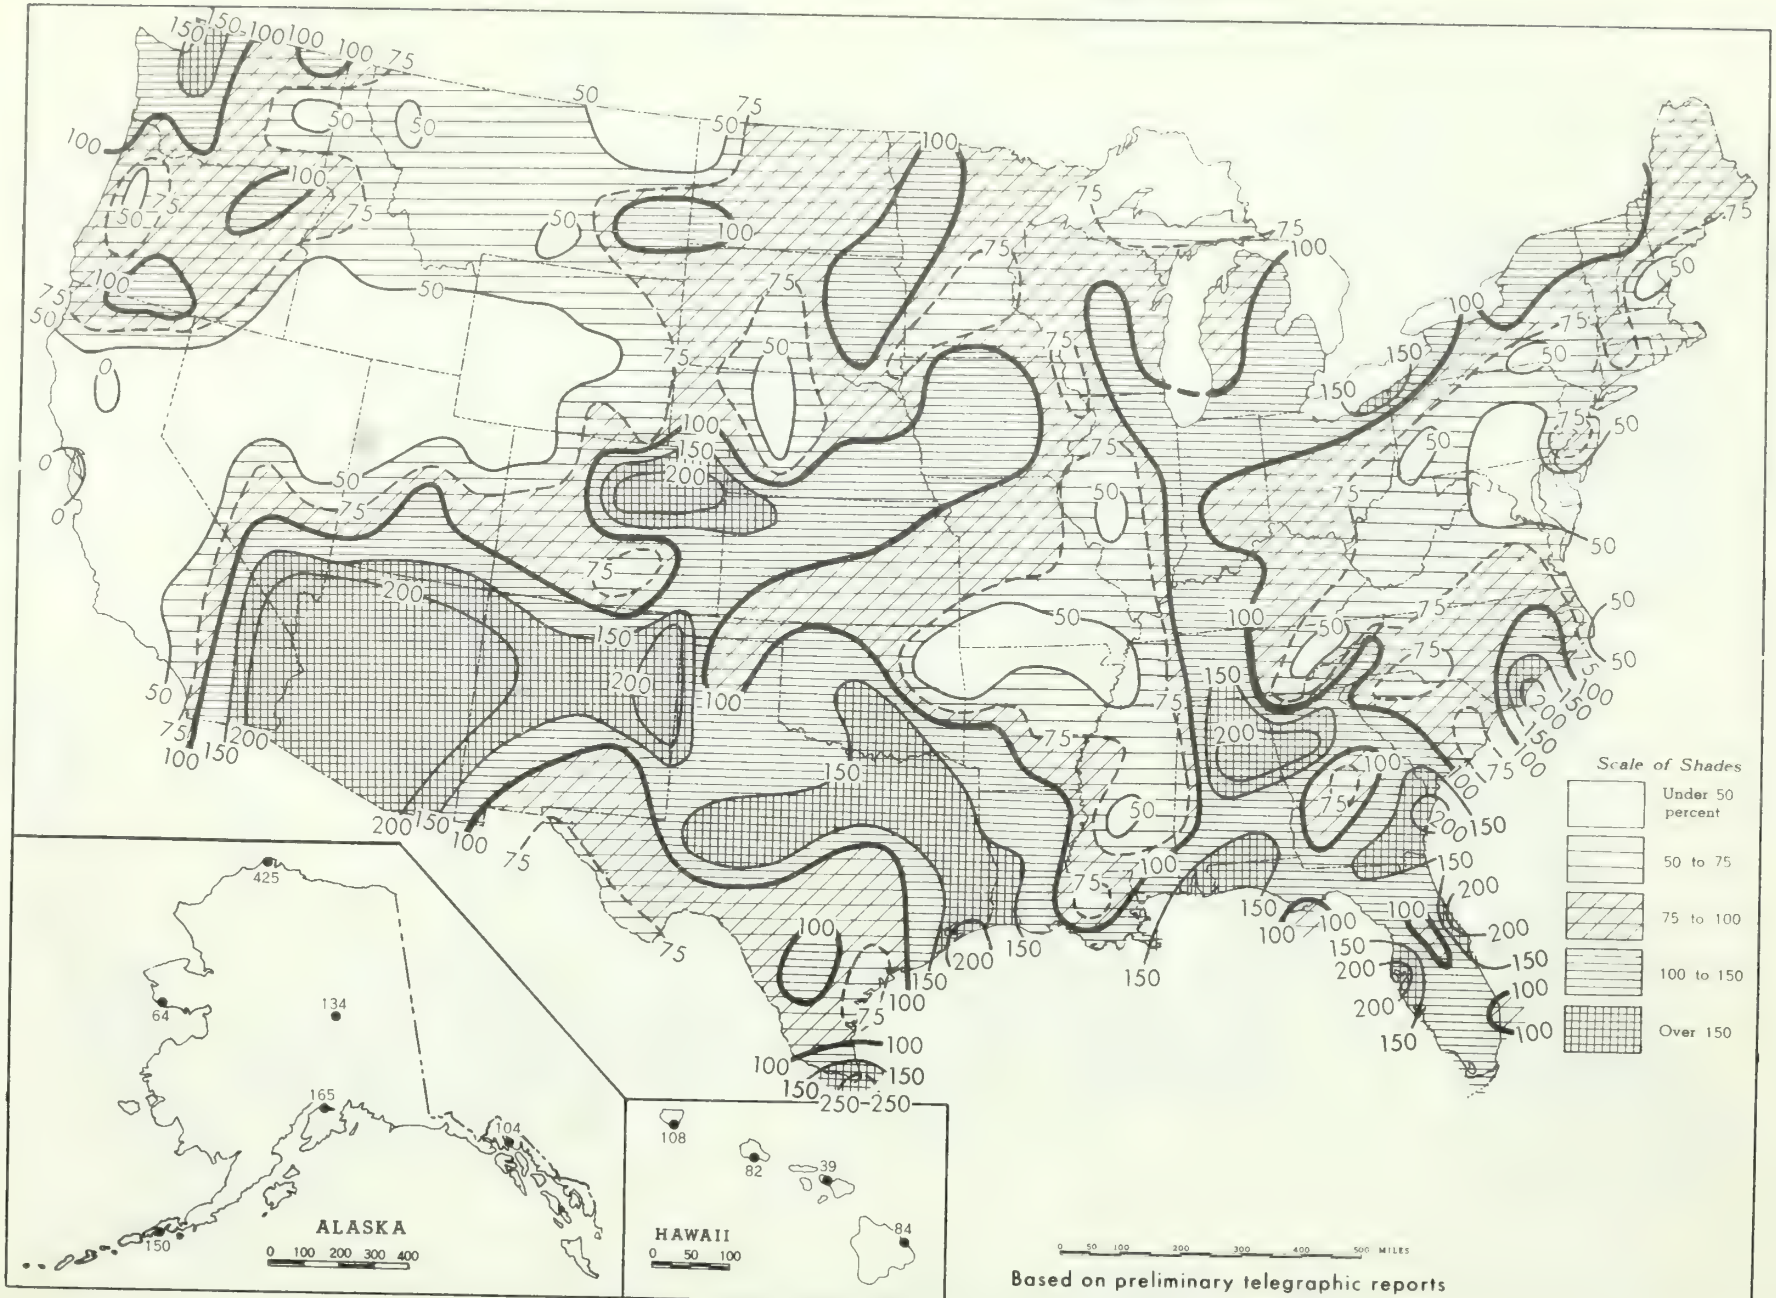

Chart VI. A. Percentage of Possible Sunshine, May 1969.

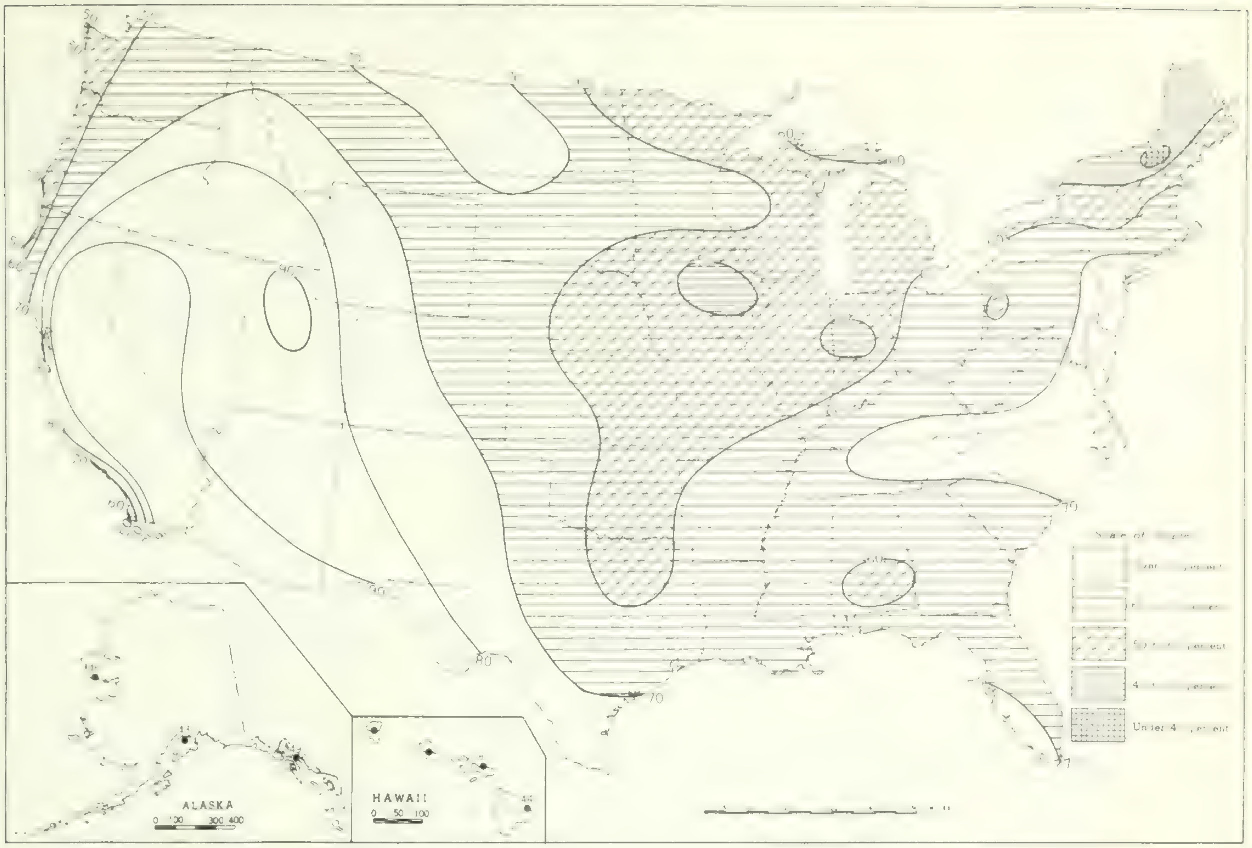
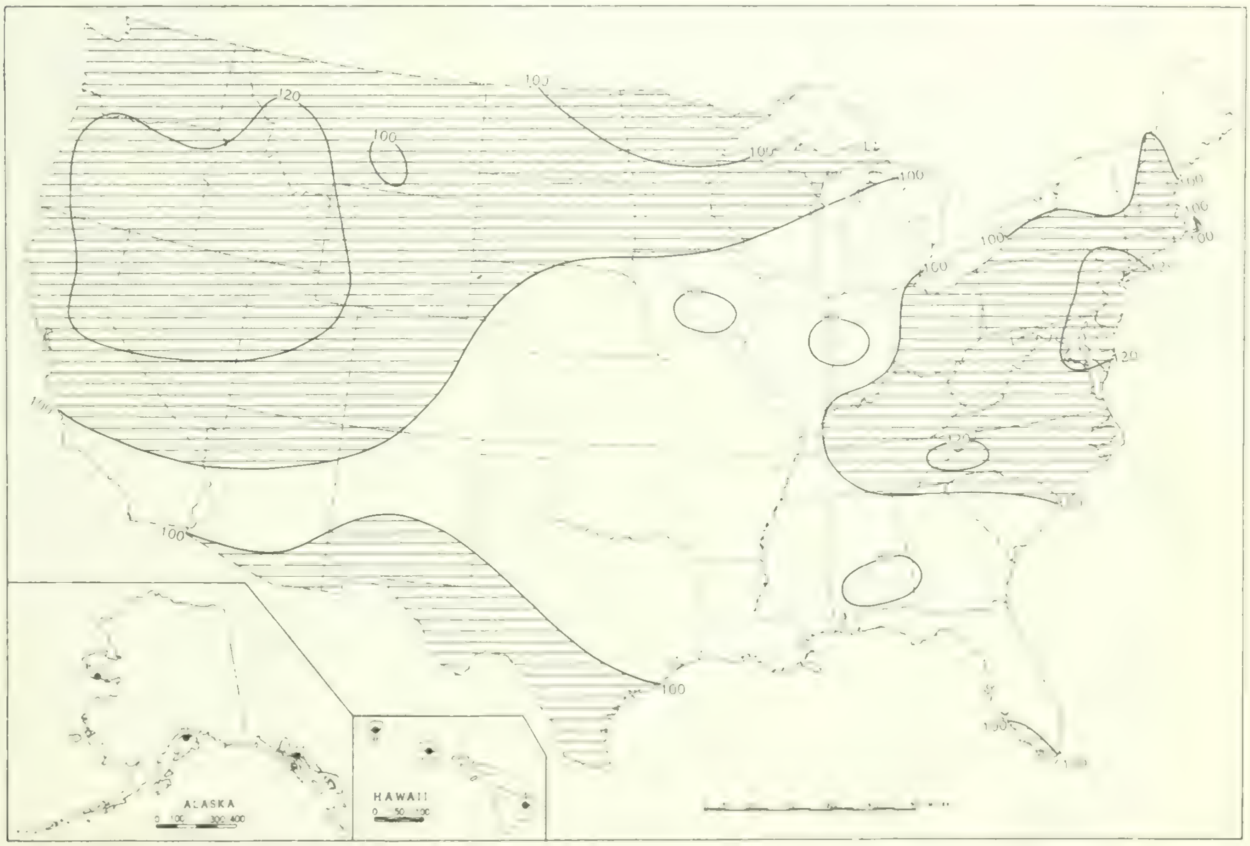
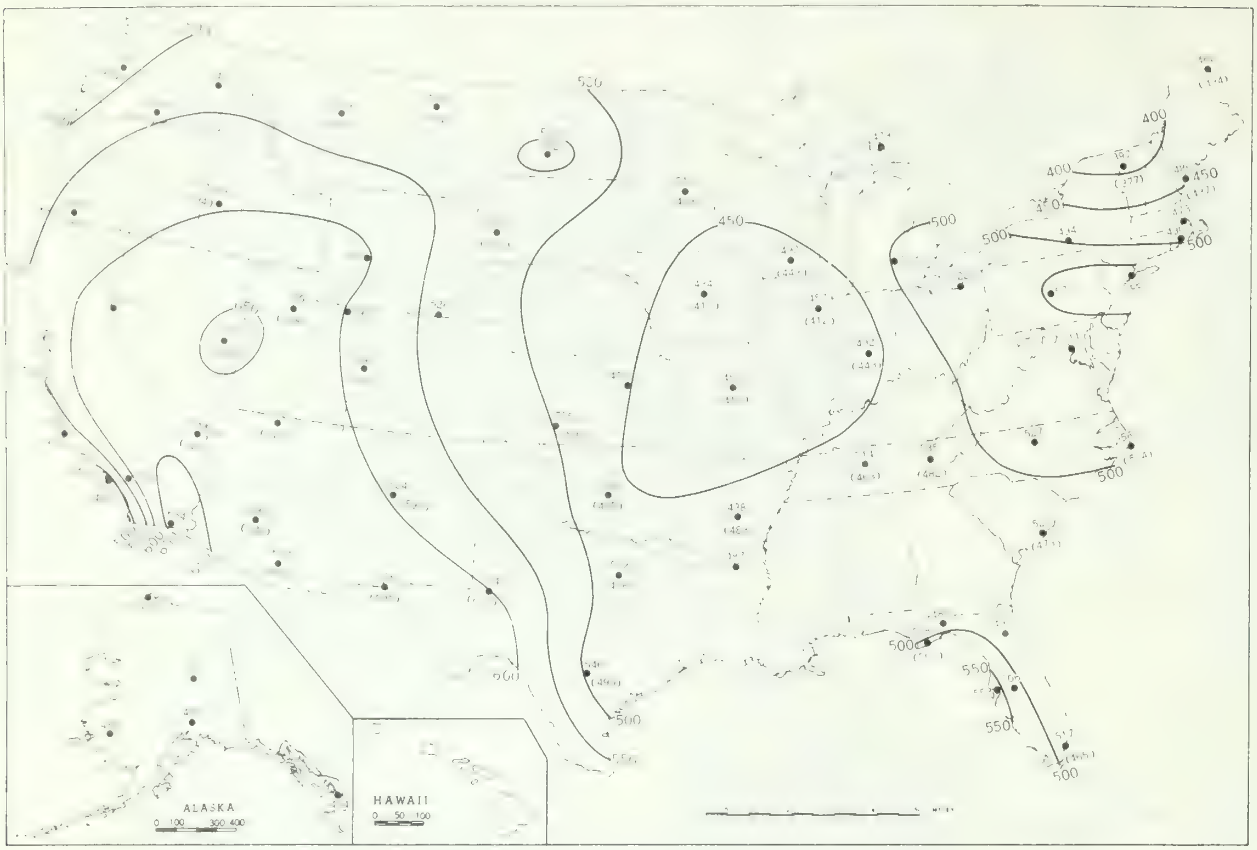


B. Percentage of Mean Monthly Sunshine, May 1969.



A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

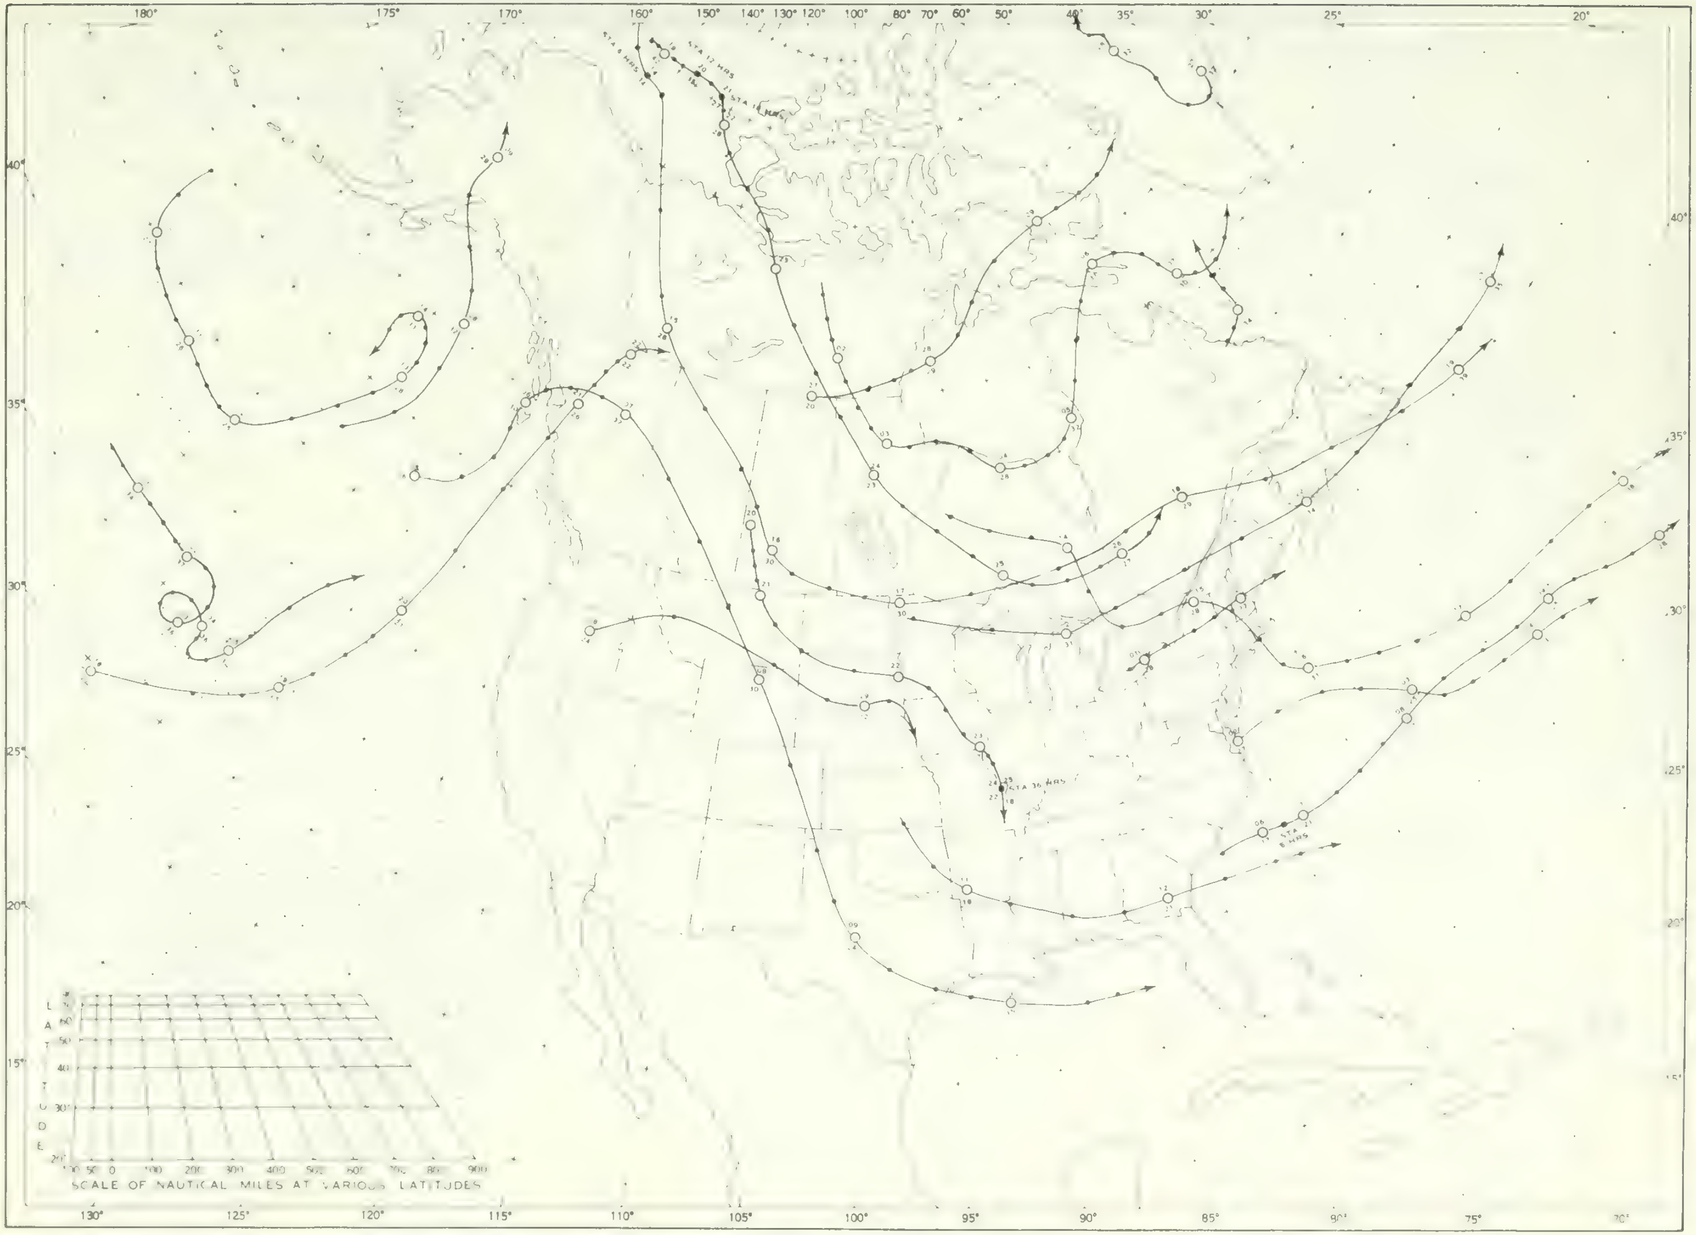
Chart VII. A. Average Daily Values of Solar Radiation, Langleys, May 1969.



B. Percentage of Mean Daily Solar Radiation, May 1969.

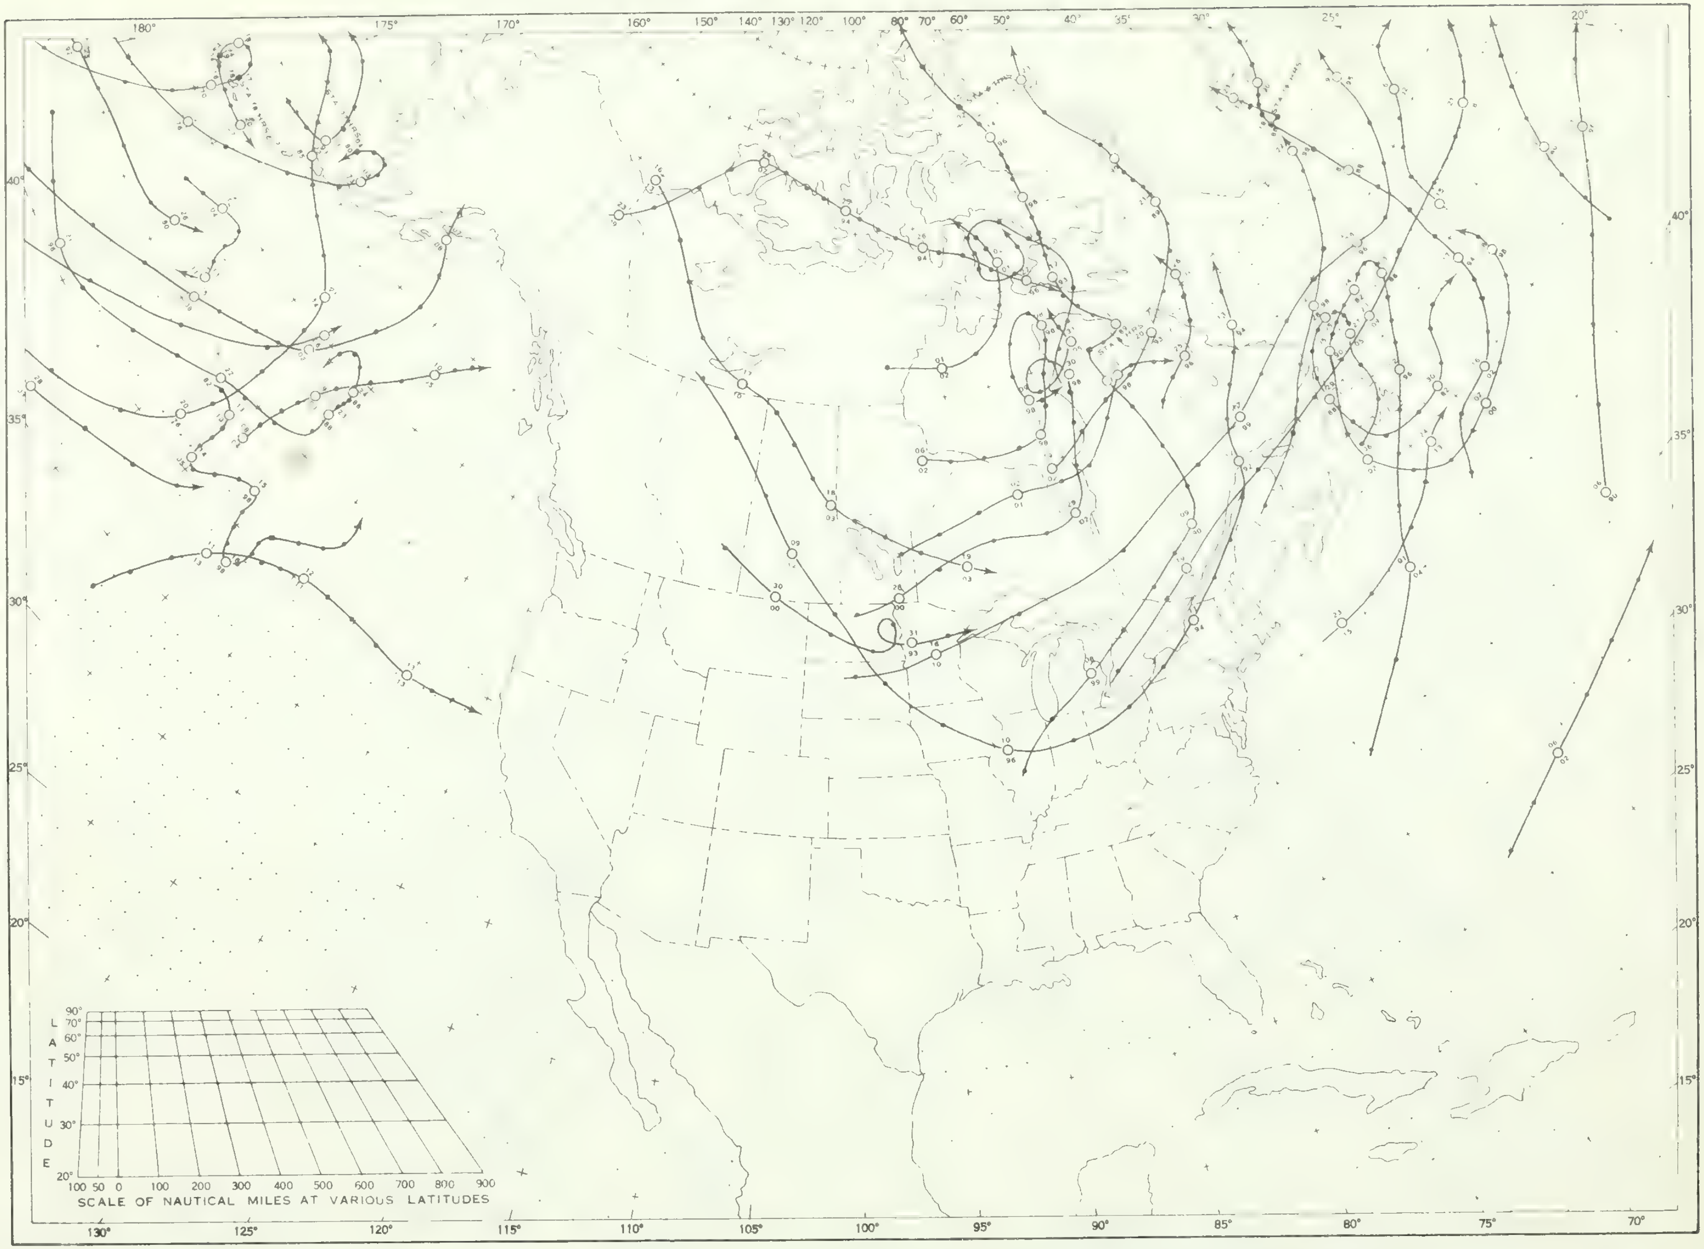
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII   Tracks of Centers of Anticyclones at Sea Level, May 1969.



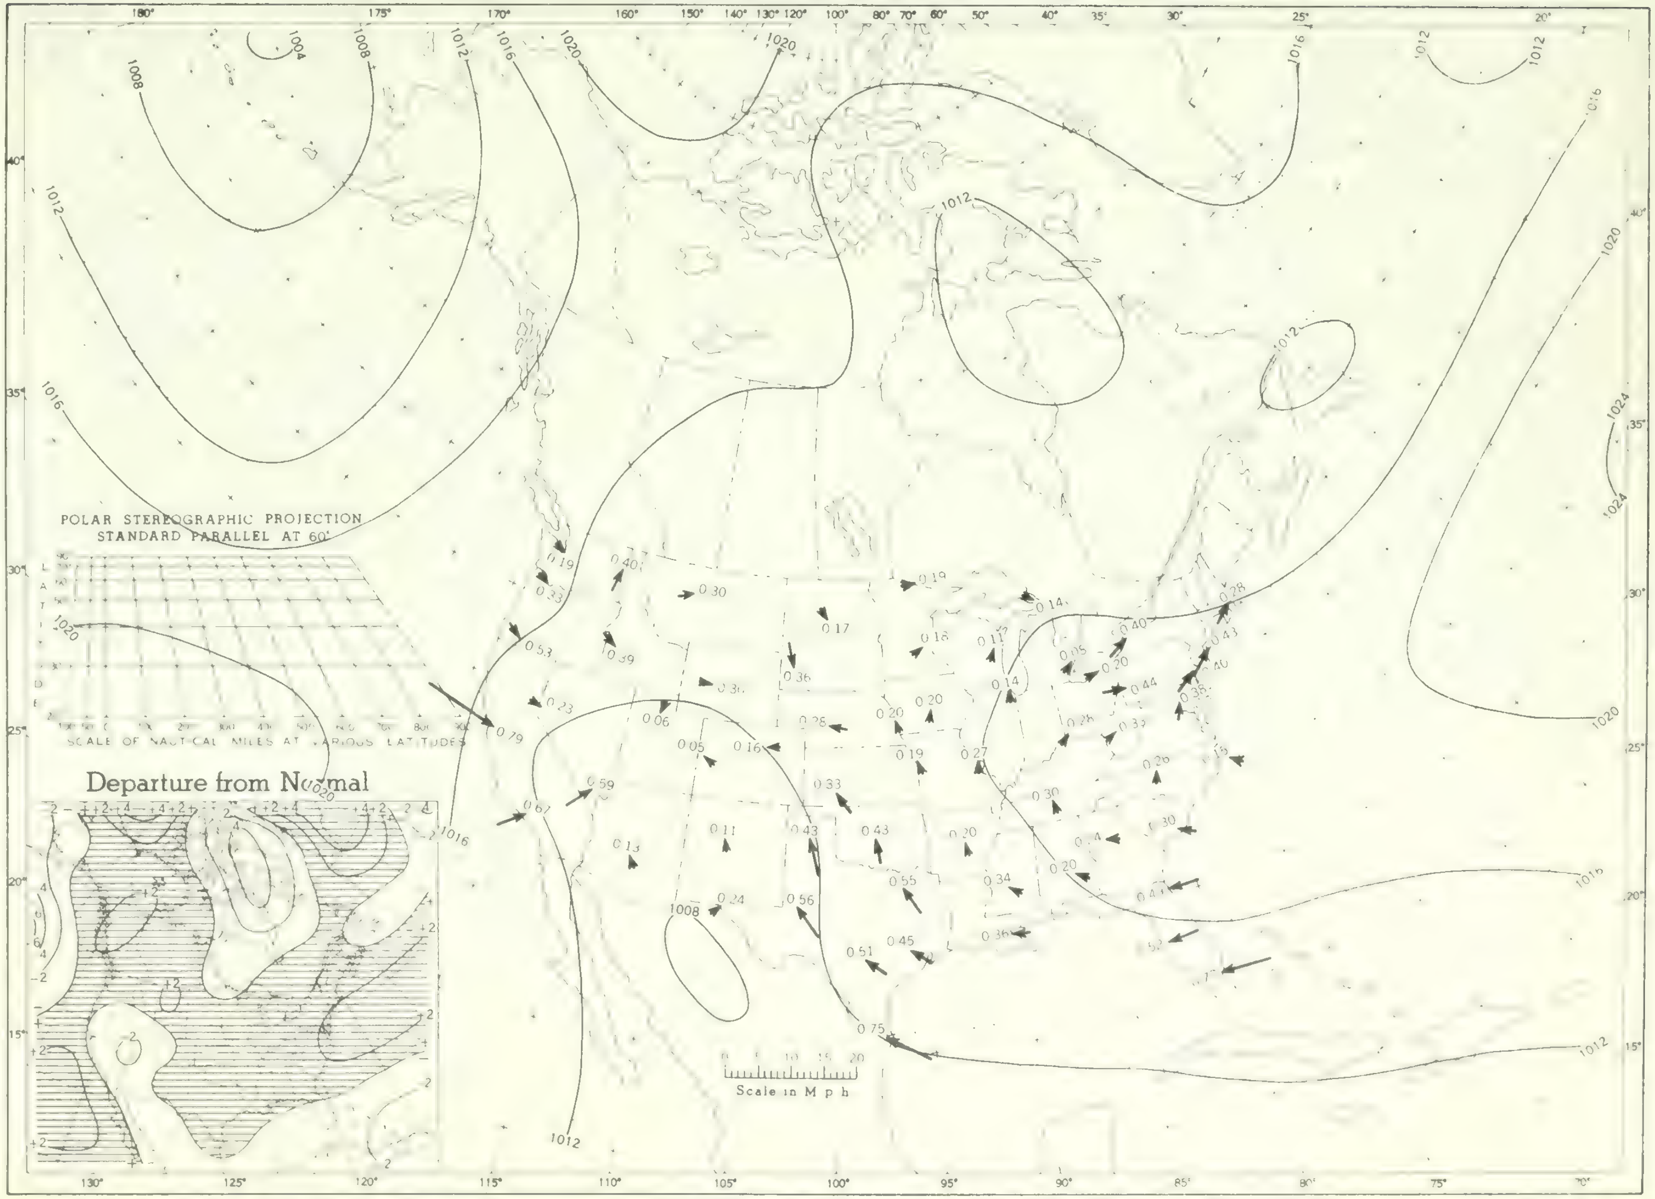
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6 hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX Tracks of Centers of Cyclones at Sea Level, May 1969.



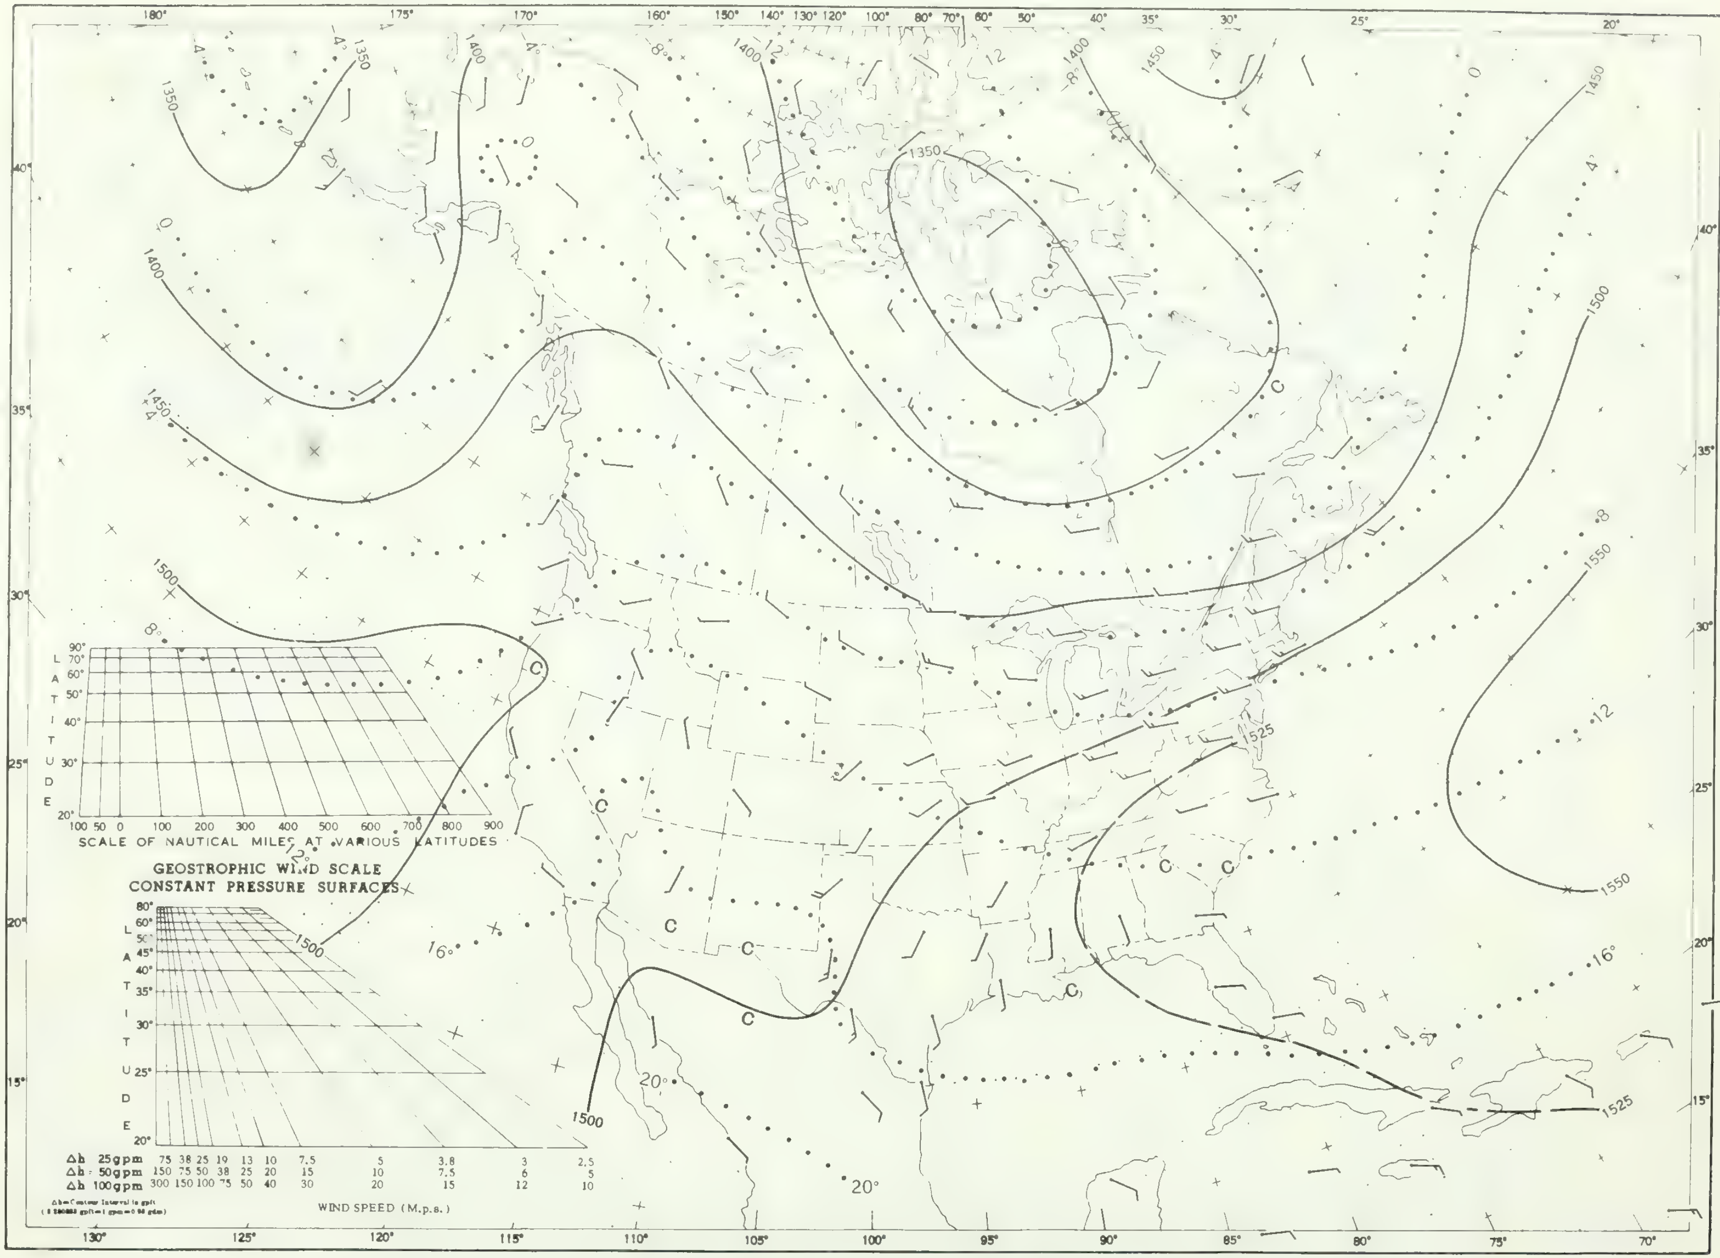
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, May 1969. Inset. Departure of Average Pressure (mb) from Normal, May 1969.



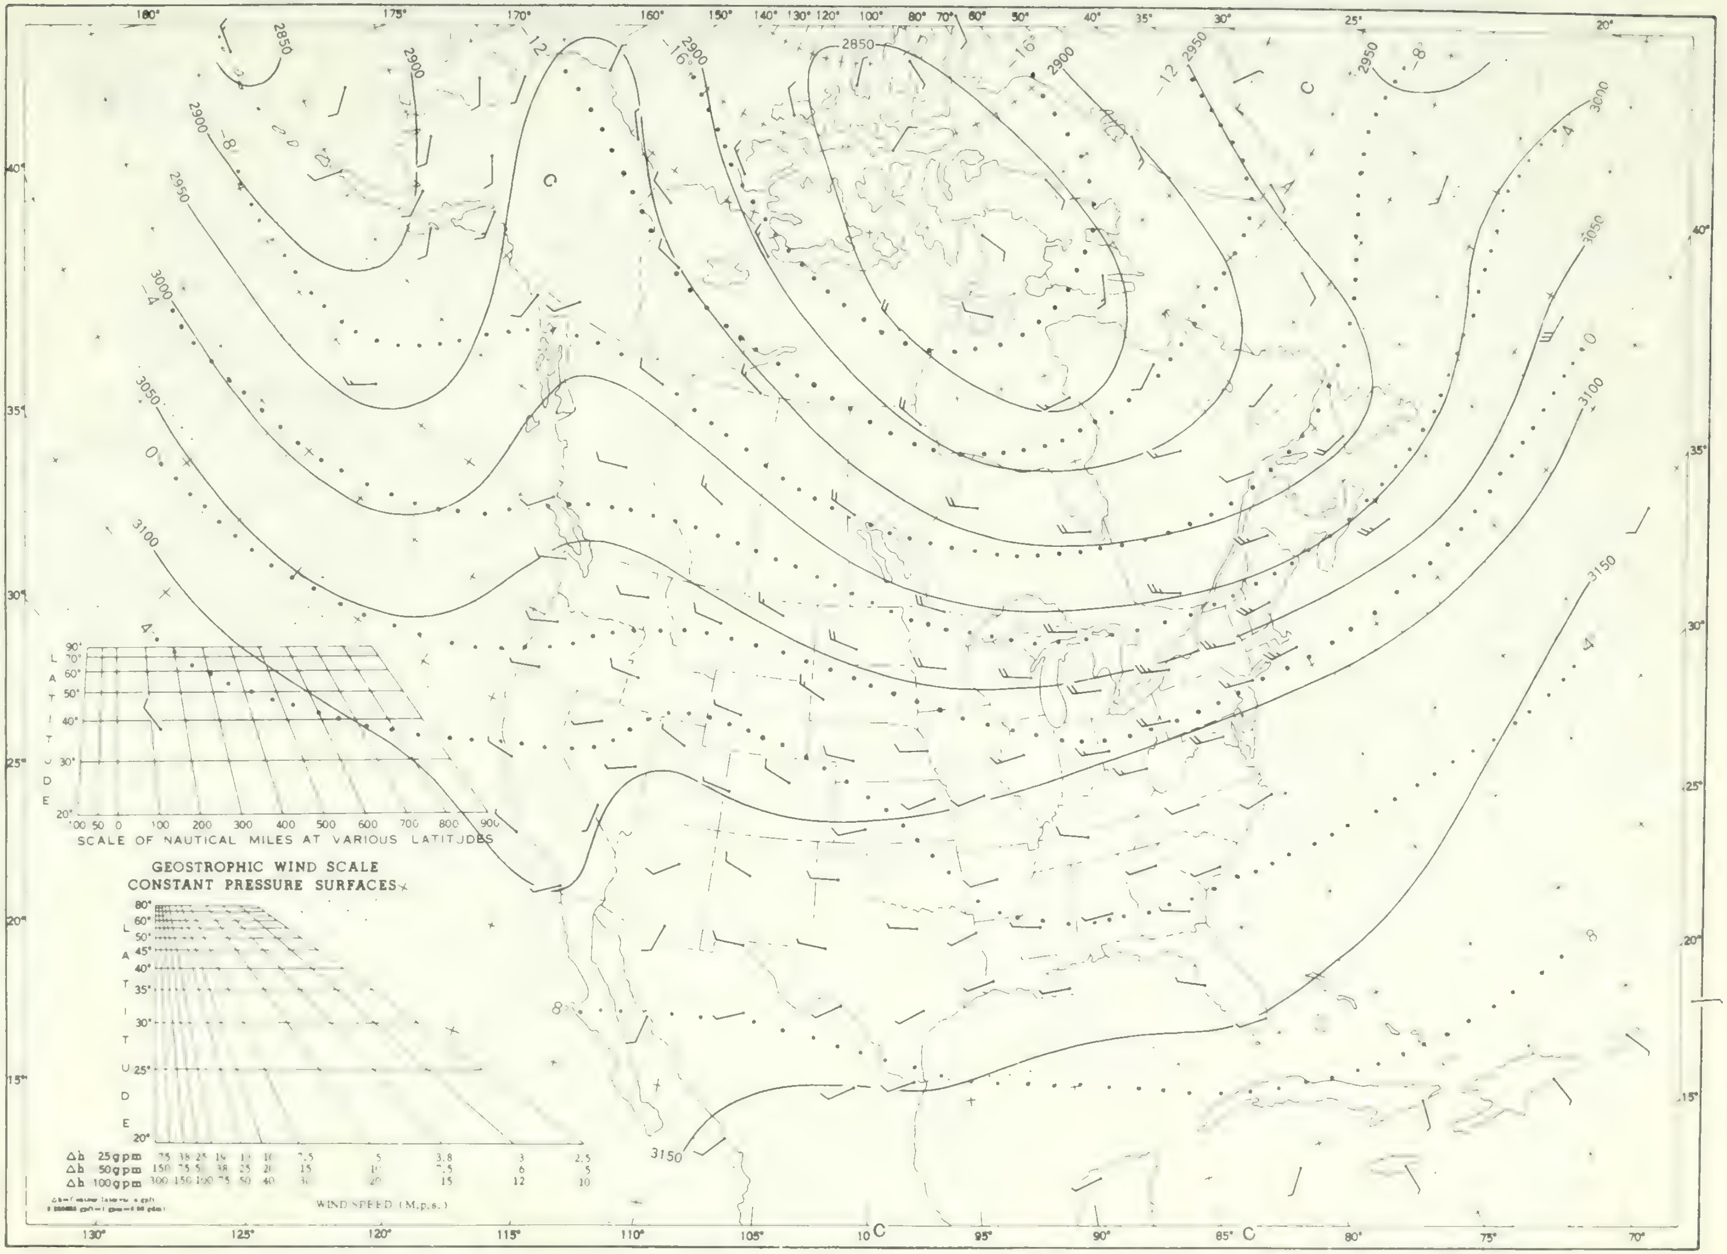
Average sea level pressures are obtained from eight daily 3 hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI 850-mb Surface, 1200 GMT, May 1969. Average Height and Temperature, and Resultant Winds.



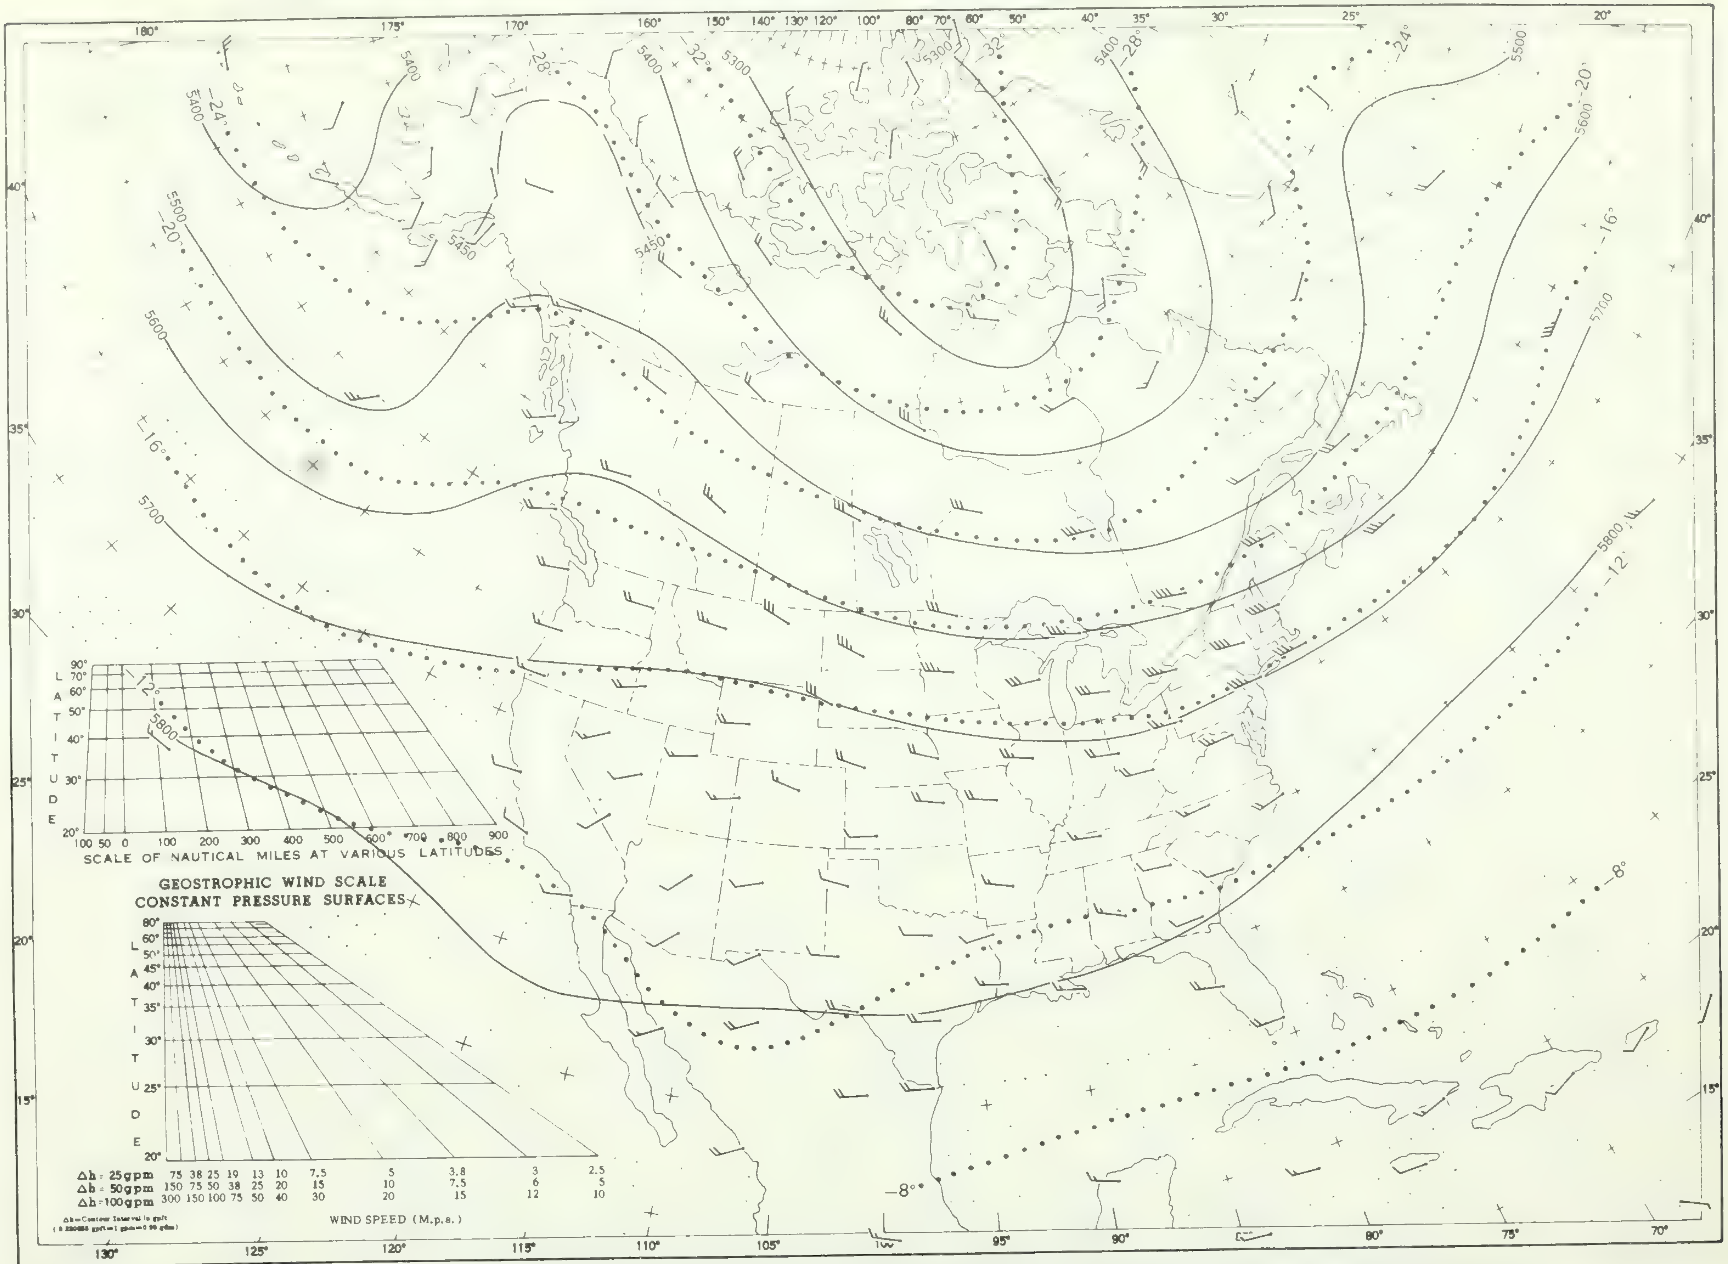
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, May 1969. Average Height and Temperature, and Resultant Winds



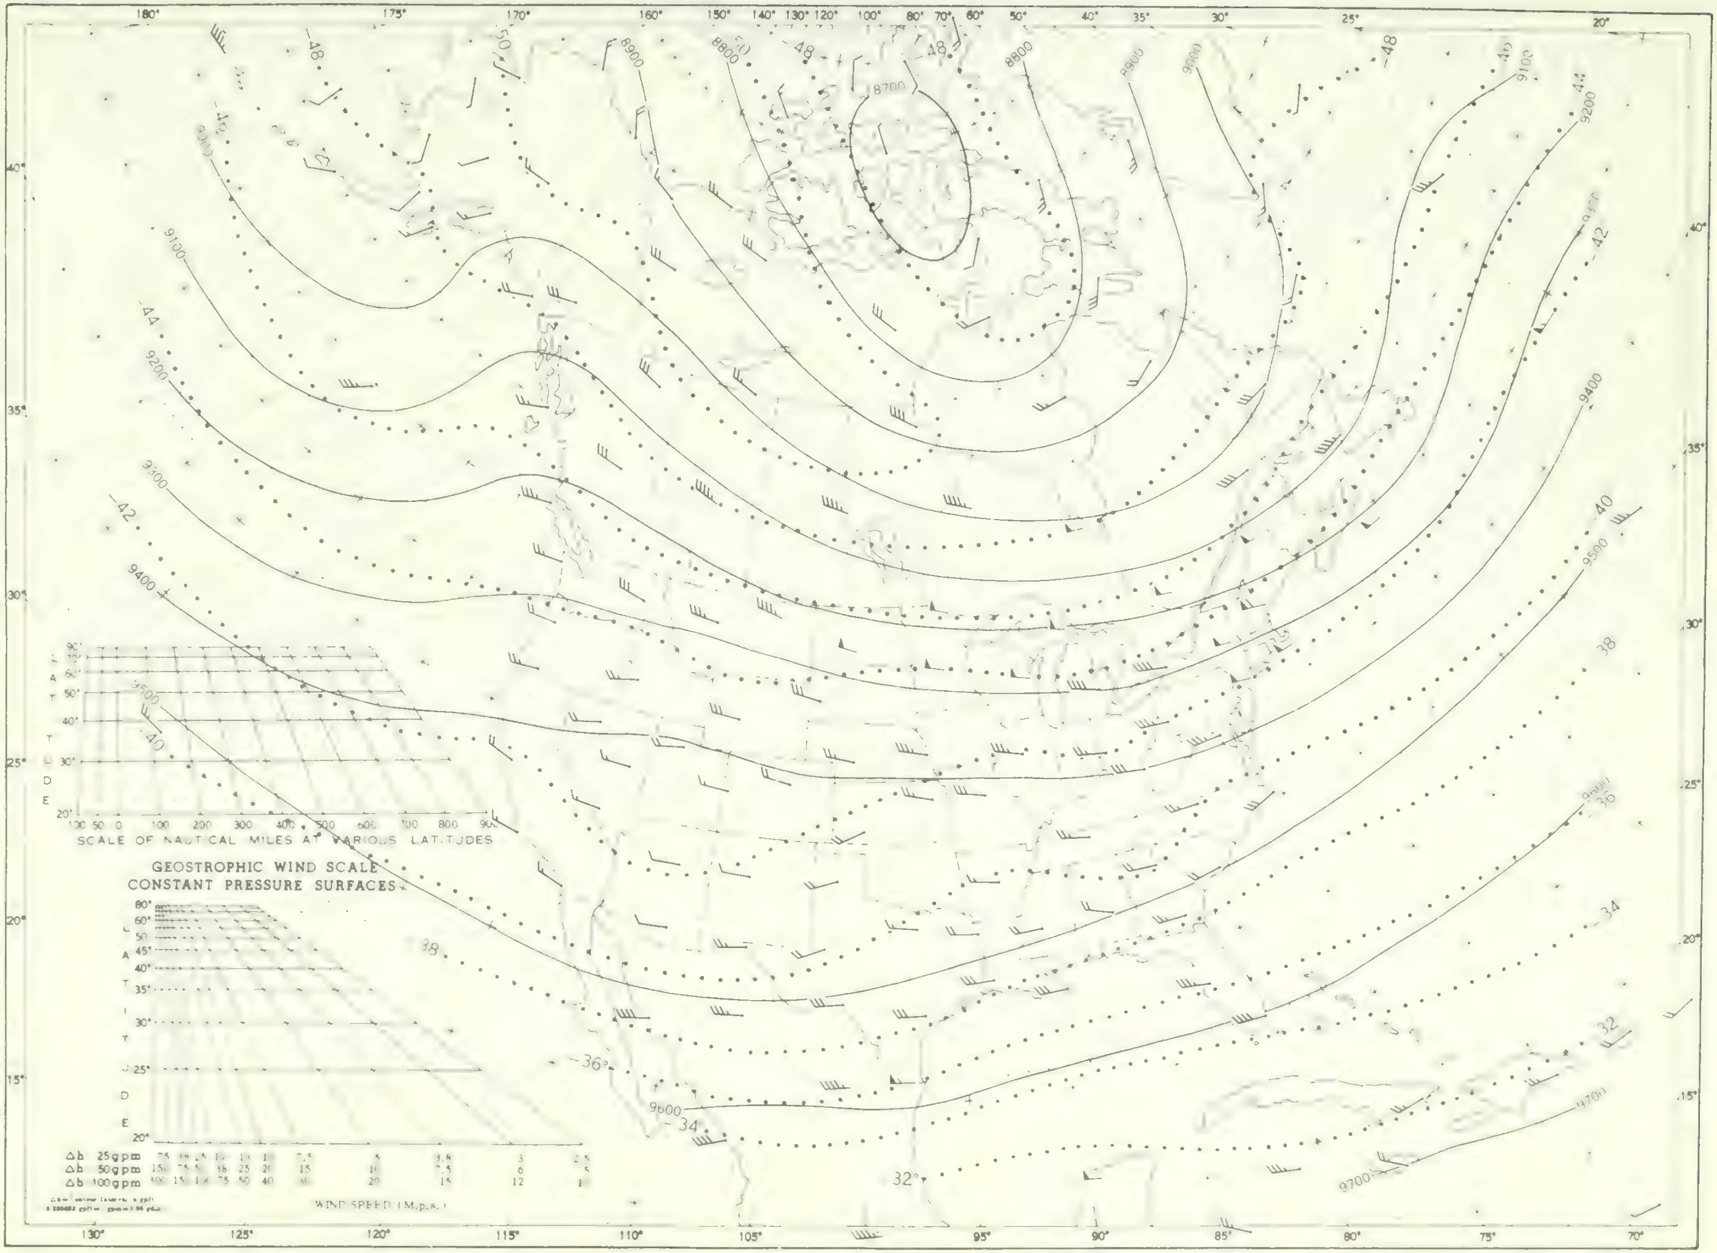
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 GMT, May 1969. Average Height and Temperature, and Resultant Winds.



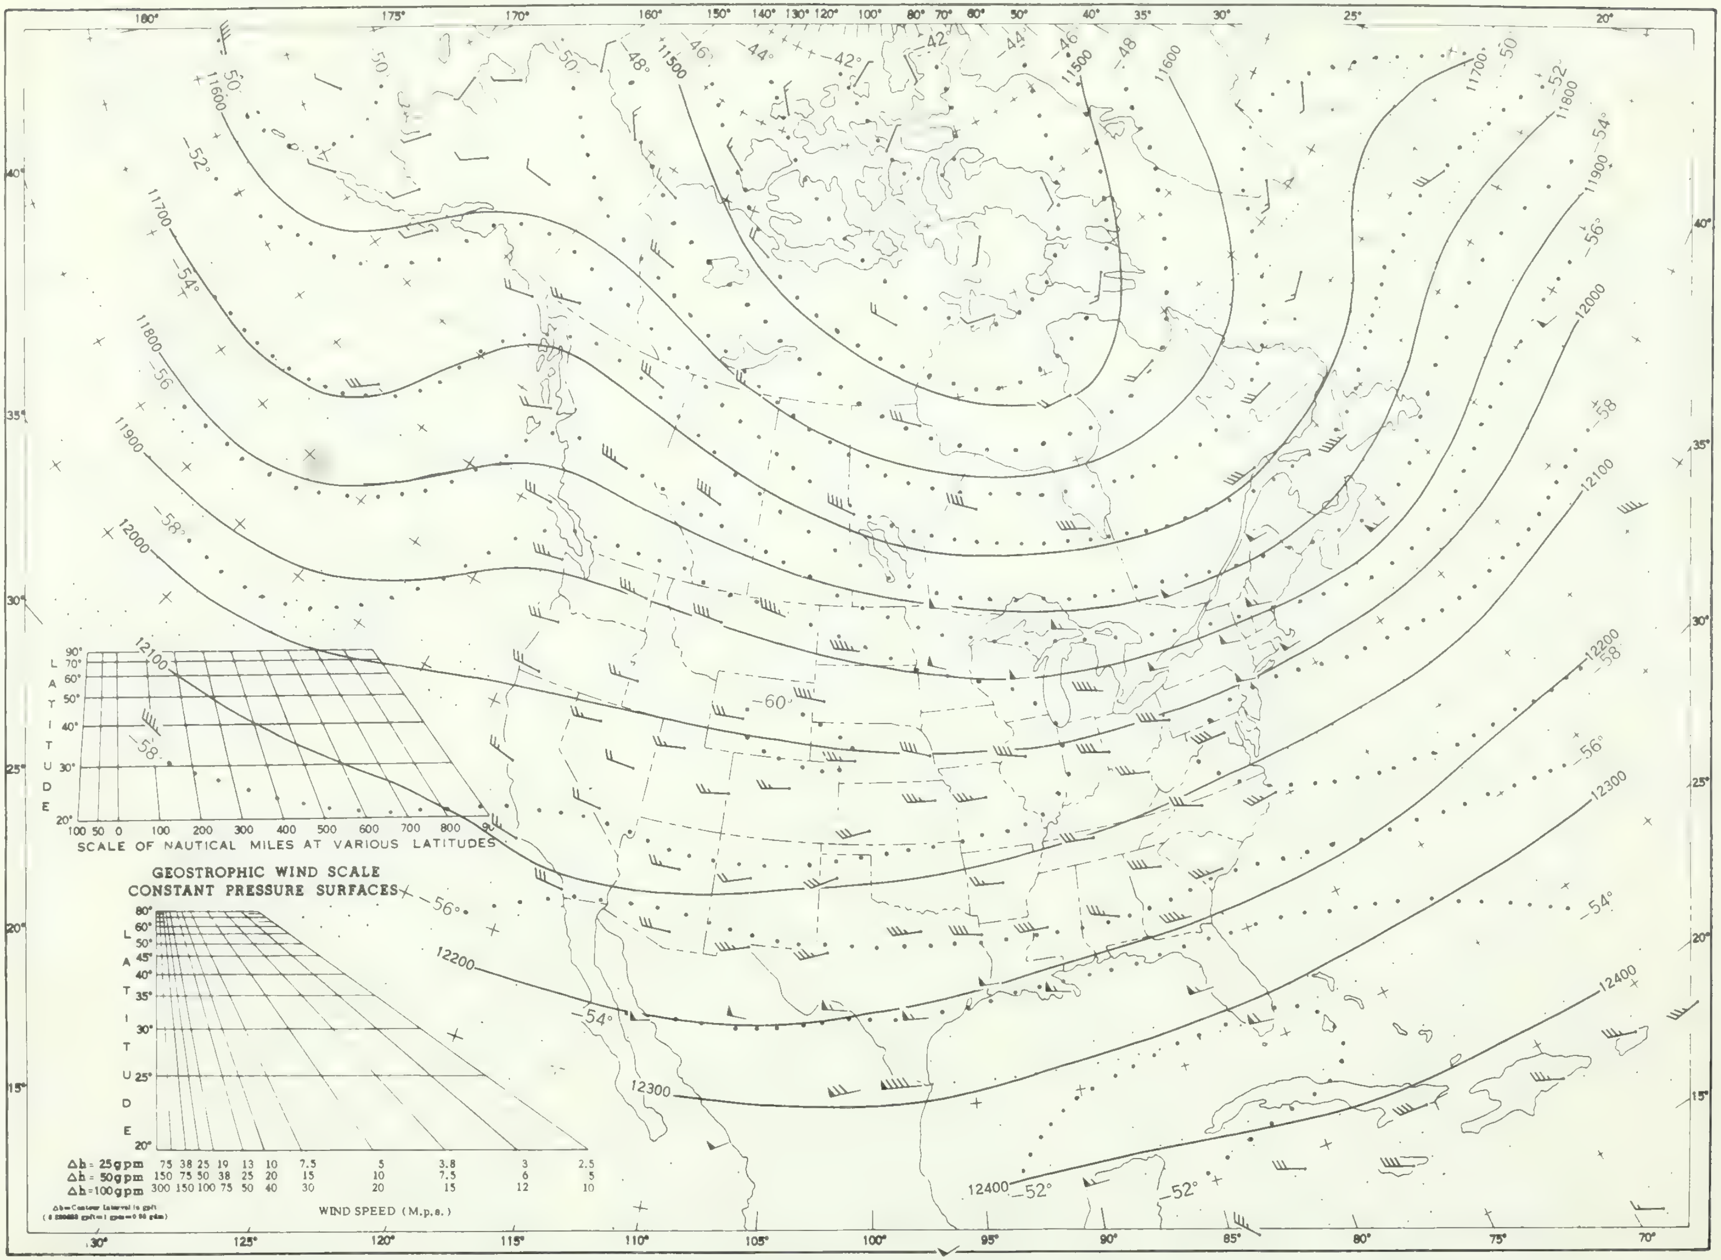
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV 300-mb. Surface, 1200 GMT, May 1969. Average Height and Temperature, and Resultant Winds



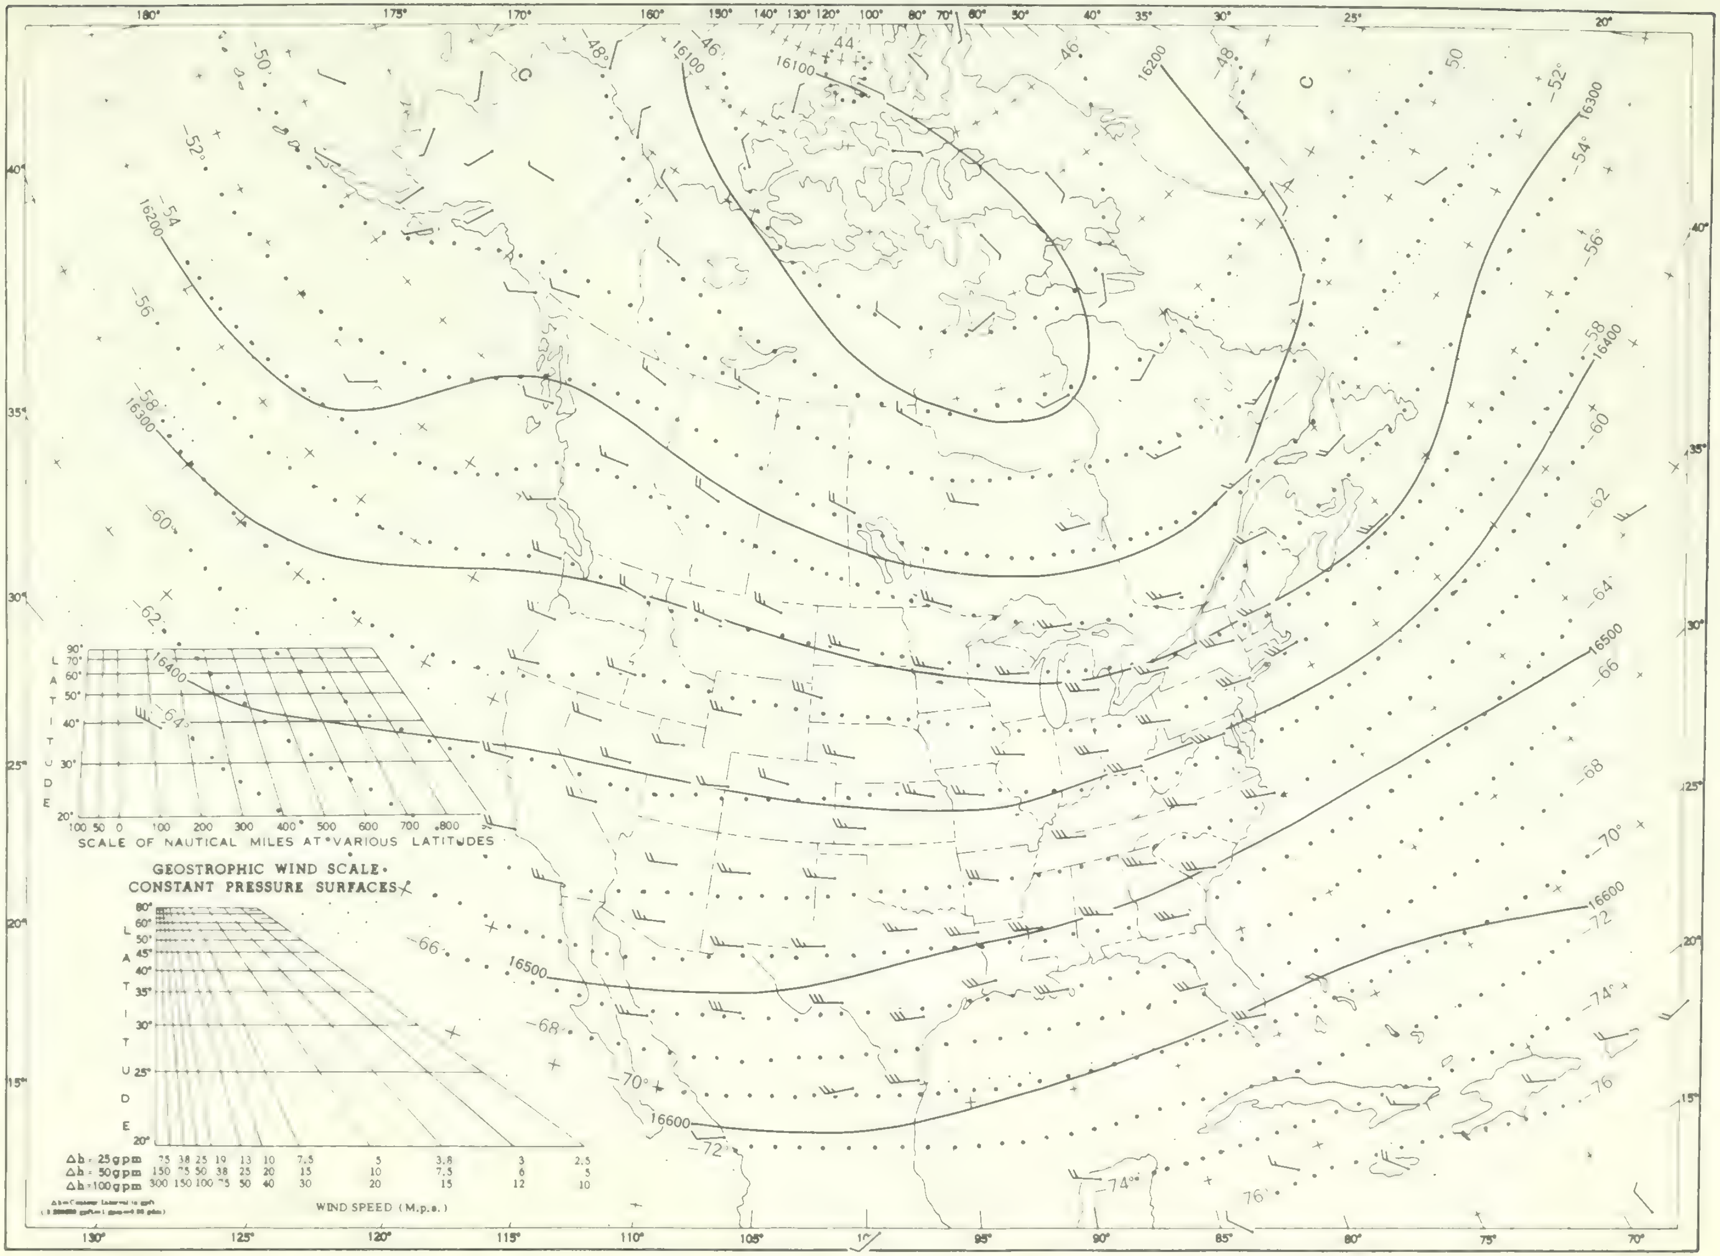
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV. 200-mb. Surface, 1200 GMT, May 1969. Average Height and Temperature, and Resultant Winds.



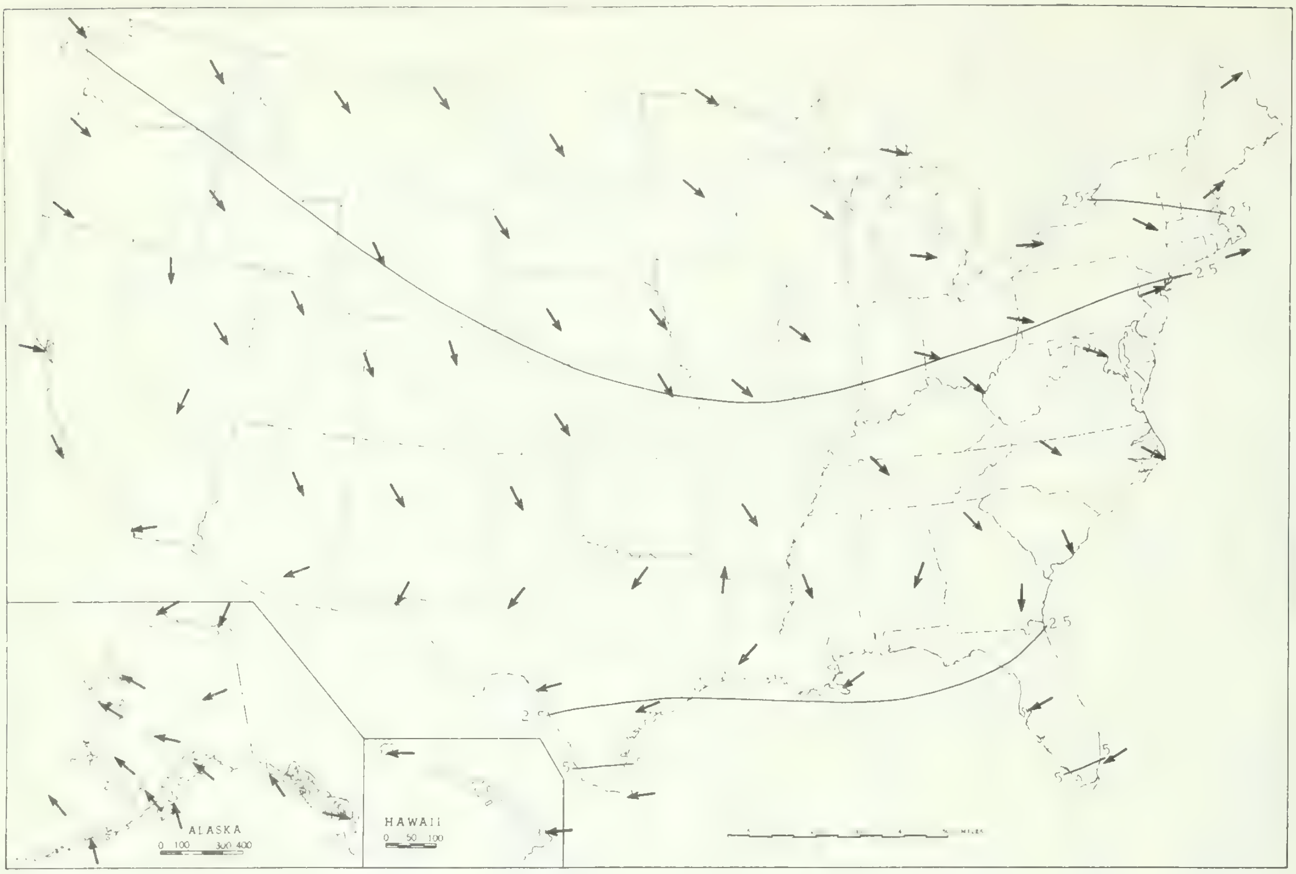
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 GMT, May 1969. Average Height and Temperature, and Resultant Winds.

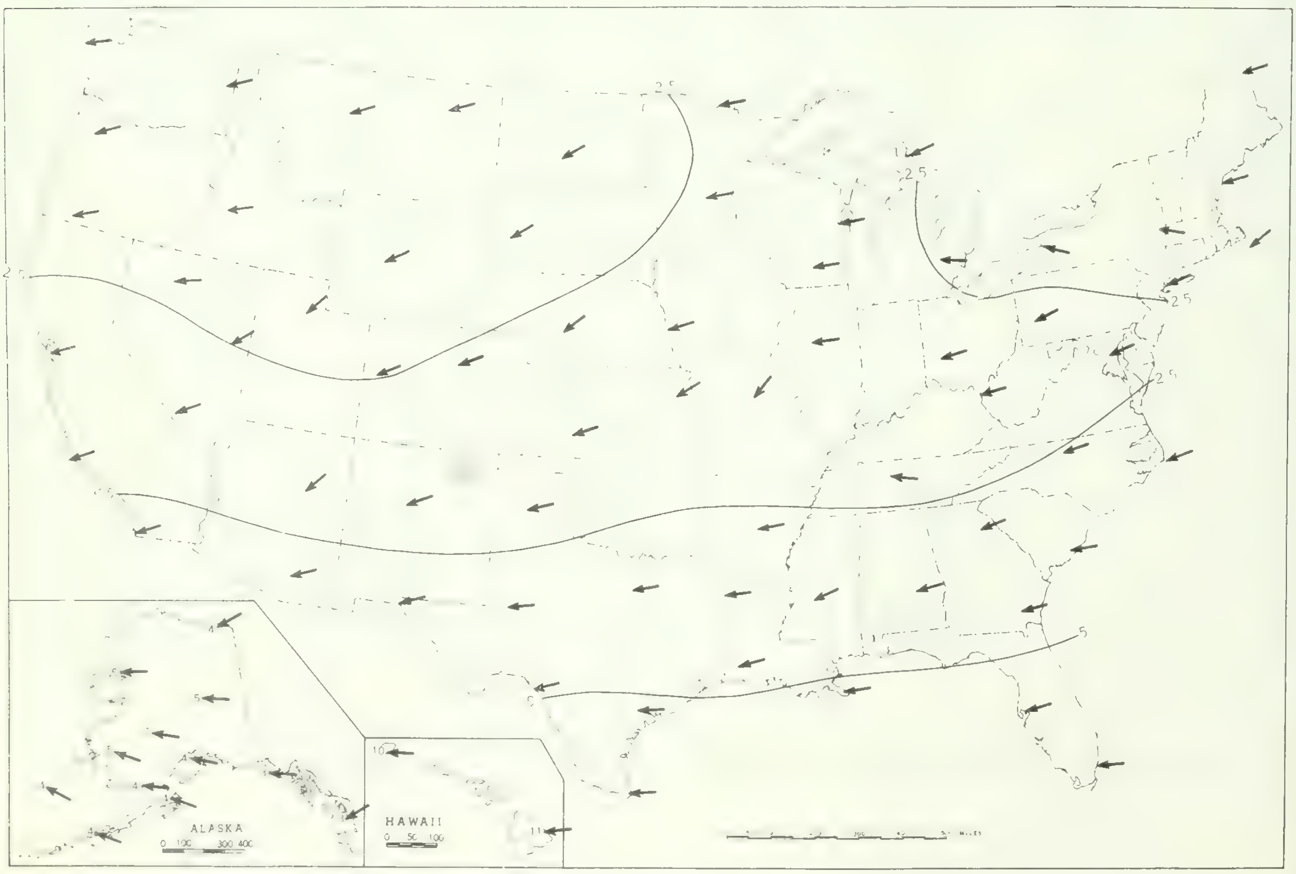


Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 GMT, May 1969. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, May 1969. Resultant Winds.



Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

NATIONAL SUMMARY

JUNE 1969
Volume 20 No. 6

Asheville 1969

CONTENTS

NOTE: Delayed data and corrections will be carried in the June and December issues of this publication. An explanatory page "Description of Charts" will be carried in the January and July issues.

SUBSCRIPTION PRICE: Monthly 20 cents and annual 40 cents per copy; yearly subscription, including monthly and annual issues, $2.50 domestic, $3.50 foreign. Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to "Superintendent of Documents, Government Printing Office, Washington, D.C. 20402"

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

JUNE 1969 Volume 20 No. 6

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:
1. June 1969 was cooler than normal over most interior States but warmer than normal along the coasts.
2. Most of the rain fell in connection with thunderstorms.
3. A total of 134 tornadoes occurred on 28 days, killing 7 persons.

TEMPERATURE.--Temperatures in June averaged warmer than normal over the Far Northwest and along the Pacific, Gulf, and Atlantic coasts, and cooler than normal over most of the interior of the Country. The northern and central Great Plains and eastward to Lower Michigan overaged 4° to 8° cooler than normal.

June began with afternoon temperatures reaching the 90's in the mid-South but with cool air moving into the Great Plains. Bismarck, N. Dak., registered 30° on June 2, the coldest June temperature in their 95-year record. The cool air spread eastward. A hot current pushed northward in the Far West, then spread eastward with 100° heat reaching the desert areas of Washington by the 4th and the central Great Plains by the 6th. The temperature at Scottsbluff, Nebr., climbed from below freezing on the 2d to 98° on the 5th. St. Joseph, Mo., on the 6th, registered 100°, the highest temperature of the season to that date. The heat wave continued its eastward journey with maximums reaching the 90's in Kentucky and Virginia by the 8th.

Meanwhile, another blast of cool air moved into the northern Great Plains and Great Lakes region, dropping early morning temperatures into the 30's and 40's. On June 14, Sault Ste. Marie, Mich., registered 32°, the coldest temperature of record for so late in the season. Moderate temperatures continued over the Northern States in the second week of June. Hot weather lingered in the South. Warm weather continued in the Northeast until near the end of the second week when afternoon temperatures dropped about 20° to the 60's and 70's.

In the third week of June, a heat wave in the Far West drove afternoon temperatures to the 90's or higher. Colville, Wash., registered 109° on June 17. As the hot spell continued in the West, cooler weather from Canada moved into the northern Great Plains. Dickenson, N. Dak., registered 47° at 2 p.m. on the 19th and, on the morning of the 20th, frost occurred over much of North Dakota and the northern half of South Dakota. The last week of June was another week of contrasting temperatures. Strong winds, reaching 40 to 50 m.p.h., brought a cooling trend to the West and North Central States while hot, humid, Gulf air warmed the South Central and Eastern States. New York and New England roasted in 90° heat. On June 28, Washington, D. C., registered 100°, the warmest temperature at Washington since July 3, 1966, when the mercury climbed to 101°. The temperature at Jackson, Miss., climbed to 100° or warmer on 9 consecutive days, from June 22 to 30. Albuquerque, N. Mex., registered 102° on the 29th, the hottest June temperature there in the 20th century. The high humidity in the East combined with the hot temperatures made the weather especially uncomfortable. Hundred-degree heat also occurred over the southwestern deserts, the western edge of the central and southern Great Plains, and the Deep South as far north as the Missouri Bootheel.

June 1969 was the warmest June in many years in parts of Oregon and Washington but it was the coolest June in many years from Minnesota and Iowa to Michigan.

PRECIPITATION.--Local showers left an uneven rainfall pattern over most of the Nation. No rain of importance fell in the southern portions of California, Arizona, and New Mexico. Precipitation ranged from no rain or only light sprinkles to 4 inches in the Far Northwest, from 2 to 4 inches over the northern and central Rocky Mountains and the northern and central Great Plains, and from 1 to more than 8 inches over the eastern half of the Nation. Monthly totals exceeded twice the normals from Nevada to the central Rocky Mountains and northward to western Montana, from north-central Oklahoma to northern Lower Michigan, and in parts of the central Appalachians.

Numerous thunderstorms, some accompanied by large hail, strong winds, and heavy downpours, occurred from Texas to the Great Lakes in the first week of June. On June 2, hail, wind, and rain damaged cotton, barley, and other crops in El Paso and Brewster Counties, Texas, to the extent of over \$1/2 million. Other hailstorms damaged roofs, broke windows, dented automobiles, and caused extensive crop damage in Terry, Castro, and Swisher Counties, Texas, on the 3d. Several tornadoes, numerous funnel clouds, and a few damaging hailstorms occurred in Missouri, Iowa, and Wisconsin on June 4. Hailstorms with stones up to 2 3/4 inches in diameter occurred in several north-central Missouri counties in the evening of June 4. A tornado collapsed a barn, killing 32 head of cattle in Grant County, Wis. Another caused extensive property damage on about 20 farms near Belmont, Wis., on the 8th. Widespread wind and hail damage occurred in West Virginia on June 8. Many areas reported hail up to 1 inch in diameter. Winds exceeded 60 m.p.h. at Charleston and Charles Town. Near Parkersburg, hail as large as golf balls damaged automobiles.

In the second week of June, widespread turbulent weather occurred east of a quasi-stationary front that stretched from Lower Michigan to Texas. Heavy rain showers fell early in the week in the Deep South and severe weather occurred in the Great Plains throughout most of the entire week. On the evening of June 10, wind and hail damage occurred in several south-central Nebraska counties. The center of activity was along an 80-mile path from Maywood to Axtell. A few of the stones attained a diameter of about 2 inches. The hail covered the ground in many areas and, at some sites in northern Frontier County, to a depth of 6 inches. Several tornadoes and a number of hail- and windstorms struck in Texas the same day. One of the most devastating hail- and windstorms occurred in Hale County. It damaged about 80% of the houses and businesses in Plainview, the County Seat. Twelve persons were injured by flying glass. Damage to automobiles exceeded \$1/2 million and glass breakage was estimated at \$150,000. Winds gusted to 70 to 90 m.p.h. On the afternoon and evening of June 11, hail, high winds, and torrential rains caused extensive damage in northeastern Kansas. Numerous

other severe thunderstorms boiled up in Iowa and a few tornadoes and other damaging storms struck Michigan, Kentucky, and Texas on June 11 to 13.

A late winter storm dumped snow in the northern and central Rocky Mountains on June 11 and 12 with accumulations up to 6 inches in the Black Hills of South Dakota. Several inches of snow fell in extreme northwestern Nebraska on the 13th.

Much of the precipitation in the 3d week of June fell in connection with thunderstorms which, in some cases, were accompanied by damaging hail and gusty winds. One of the fiercest hailstorms, with hail up to 3 inches in diameter, caused over $1 million damage to property and crops in the Comanche, Texas, vicinity on the 18th. The jagged hailstones shattered about 95% of the windows on the south and west sides and damaged the roofs of about 95% of the homes in Comanche. Winds accompanying the storms were estimated to have reached 80 m.p.h. Ten persons suffered injuries in connection with the storm. More severe thunderstorms and a few twisters struck mid-America at the end of the 3d week of June.

Substantial rains fell in most Northern States in the last week of June. Totals of 1 to 3 inches were common over the northern Great Plains with 5-inch weekly totals causing some local flooding in Montana. Numerous tornadoes and severe thunderstorms struck from the central Great Plains to the Atlantic Ocean. Heavy rains caused local flooding in south-central Kentucky and north-central Tennessee. Several inches of snow fell in the Colorado Rockies. This was the 4th consecutive wet week in Minnesota and the 7th consecutive dry week in parts of the Deep South.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1 C. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

C Crop damage
° Includes crop damage
S Several

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
\# Freezing drizzle and freezing rain, commonly known as glaze.
∅ For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, ESSA, monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000
7 $5,000,000 to $50,000,000
8 $50,000,000 to $500,000,000
9 $500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

JUNE 1969

Elmer R. Nelson, Office of Hydrology

Near record overflows occurred on tributary streams in the lower Smoky Hill River Basin in Kansas during June. Record stages occurred in the headwaters of the Marais des Cygnes River. Severe flooding occurred on tributary streams of the Missouri in northwestern Missouri where nearly 200,000 acres of farmland were flooded.

Severe flash floods occurred on the Barren River in Kentucky and on Salt Lick Creek in northern Tennessee. Discharge ratings on the upper Barren River were reported as the greatest of record.

ATLANTIC SLOPE DRAINAGE

Heavy showers and thunderstorms on the 15th caused some flash flooding in western Connecticut and central New Hampshire. The rainfall totaled over 3 inches in about a 6-hour period in sections from southern Maine to western Connecticut. Much of the flooding was due to culvert overflow. Minor property and road damage resulted.

Heavy local thunderstorms during the night of the 23d caused minor flooding on the Tioughnioga River at Whitney Point, N. Y.

Flash floods were reported in the upper Lehigh Valley in Pennsylvania on the 14th. Rainfall in excess of 4 inches was recorded from Freeland eastward to Long Pond, Pa., where flooding and some road washouts occurred during the evening of the 14th and the morning of the 15th. A severe thunderstorm on the 23d caused flash flooding over a wide area from the southern sections of Philadelphia, Pa., eastward to the Woodbury-Berlin area of central New Jersey. The Weather Bureau at Philadelphia, Pa., reported 1.27 inches of rain in 10 minutes. Heavy rains occurred again on the morning of the 25th with 2.09 inches of rain in 2 hours. Localized flash flooding occurred during the predawn hours.

A series of thunderstorms from the 13th through the 16th caused a one-foot overflow of Tunkhannock Creek at Dixon, Pa., on the 15th. The total precipitation during this period was 5.98 inches. The Tunkhannock crested at Dixon after 2.52 inches of this total fell on the 15th.

Heavy thunderstorms in the Greensboro, N. C., area during the afternoon of the 15th caused flooding of the main stems of North Buffalo and South Buffalo Creeks. Some of the major tributaries also flooded, although the smaller tributaries were not generally at flood stage. Property damage was estimated at $1.3 million.

Locally heavy thundershowers caused the Lumber River at Lumberton, N. C., to rise above flood stage on the 9th. Continued scattered thundershowers kept the Lumber River above flood stage until July 17. The highest stage reported (13.0 ft.) occurred on June 18 and was 5 ft. above flood level. The flooding on the Little Pee Dee River at Galivants Ferry, S. C., on the 18-30th was due to scattered thundershowers from the 11th to the 15th. The Edisto River at Givhans Ferry, S. C., continued in flood from May 23 to June 3. Flood damage was minor.

Light flooding occurred on the Satilla River near Atkinson, Ga., from May 30 to June 7. The crest on June 1 was 2.3 ft. above flood stage.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--June was a cold month in the Upper Mississippi Basin above Guttenberg, Iowa, with temperatures 4° to 8° below normal. The first three weeks were dry, although quite cloudy with light day-to-day precipitation.

The dry period ended late on the 22d and early on the 23d when rain began falling over southern Minnesota, northern Iowa, and central and eastern Wisconsin. The rains on the 22-23d had barely soaked into the ground when 2 to 5 inches of rain fell over northern Iowa and southwestern Minnesota early on the 25th. The rains continued to the 26th with additional rain of 2 to 5 inches in southeastern Minnesota, northern Iowa, and central and eastern Wisconsin on the 27th. Runoff was greatest along the Root River in southeastern Minnesota, the upper Iowa in northeast Iowa, and the Black and Wisconsin Rivers in central Wisconsin. Little or no damage resulted from the minor flooding on the Root, upper Iowa, and Wisconsin Rivers.

Widespread heavy showers on the 25-29th caused flooding on the Turkey, Maquoketa, and Wapsipinicon Rivers in Iowa and on the Pecatonica River in Wisconsin. Many stations reported over 2 inches of rain on the 26th and 27th. Darlington, Wis., recorded 6.35 inches in 4 hours on the 29th. The Wapsipinicon and the Pecatonica at Martintown, Wis., were still rising at the end of the month.

Frequent and heavy rains during June over the northeast quadrant in Iowa and adjacent areas caused considerable flooding in the Iowa-Cedar and Skunk River Basins. Crest stages in the upper Cedar were higher than during the 1969 spring flood. The crest at Waterloo, Iowa, was the 3d highest crest of record, exceeded only in 1961 and 1965.

Missouri Basin.--Heavy precipitation during the latter half of June caused local flooding on East Gallatin River and Sourdough Creek in the Zortman, Mont., area during the last week in June. Several mountain roads and metal culverts were washed out.

The James River at Columbia and Stratford, S. Dak., continued above flood stage through June. At the end of the month, it was 0.8 ft. above flood stage at Columbia and a little over 1 ft. above flood stage at Stratford. Thunderstorms on the 28-29th caused flooding on the Rock River in Iowa. Rainfall amounts up to 6.5 inches were reported in the upper reaches in southwestern Minnesota. At Rock Rapids, Iowa, the river rose about 6.5 ft. above flood stage and 5 ft. over flood stage at Rock Valley, Iowa, on the 29th and 30th. Dikes used during the spring snowmelt flood alleviated urban flooding. Minor damage resulted to parks near the river.

Heavy rains during the night of the 24-25th in the Little Sioux Basin in Iowa caused flooding in the upper and middle reaches during the latter part of June and early July. The rainfall amounts averaged about 3 inches with the greatest falls of near 5 inches between Cherokee and Peterson, Iowa. Damage was slight and confined mostly to debris over some low places on roads from Cherokee to Correctionville, Iowa.

Heavy rains during the early morning hours of the 25th caused flash flooding and light to moderate lowland flooding in the Elkhorn Basin in Nebraska. Rainfall amounts which ranged up to 4 to 5 inches in about 6 hours caused flash flooding on Union, Battle, South Logan, and Taylor Creeks. Light to moderate lowland flooding occurred on the North Branch Elkhorn from Pierce, Nebr., downstream to the diversional channel at Norfolk, Nebr., and on the Elkhorn River in the Norfolk and Scribner vicinities.

Minor local flooding occurred in the South Platte River in the Denver, Colo., metropolitan area from a severe thunderstorm during the afternoon of the 8th.

Severe flooding occurred in some of the underpasses along Interstate Highway 25 because of hail-clogged drains. Numerous automobiles were trapped in the underpasses that were completely filled with water. Unofficial precipitation amounts up to 4 inches were reported during the storm. General showers continued over eastern mountain slopes and plains of the South Platte drainage through the 17th. Most of this precipitation resulted in runoff since Denver Water Board reservoirs and others had been filled by heavy rains in May. The South Platte above Denver, Colo., rose slowly to a crest below flood stage on the 19th and 20th. Extensive flooding occurred in the drainage below Denver the following week. This flooding was due to heavy flows from the St. Vrain, Big Thompson, and Cache La Poudre Rivers.

Near record overflows developed on tributary streams in the lower Smoky Hill River Basin in Kansas. Lyon Creek near Woodbine, Kans., crested 13.74 ft. above flood stage on the 12th. This was the second highest stage of record and had been exceeded only in October 1967 when it reached a stage of 31.50 ft. Turkey Creek near Abilene, Kans., which crested 11.5 ft. above flood stage, on the 12th had a recurrence interval of 10 years by USGS data. In the Kansas River Basin, stages on the Wakarusa River near Lawrence, Kans., exceeded flood stage by 7.3 ft. on the 27th. This stage had been exceeded materially in June 1967 by 0.6 ft. and by the record crest of 31.59 ft. in July 1951 by 1.3 ft. Major flooding occurred on the Marais des Cygnes River in Kansas. Record stages were reached in the headwaters at Reading, Kans., with a crest of 27.5 ft. on the 27th. This was 9.5 ft. above flood stage and 0.7 ft. above the previous highest stage of record (26.80 ft.) in Oct. 1967. Crests along the main stem which ranged from 5 ft. to as much as 11 ft. above flood stage at Osawatomie, Kans., have been rather infrequent. Dragoon Creek near Burlingame, Kans., approached record levels on the 27th. Damages were heavy due to the lateness of the season and consequent crop losses.

Rainfall over most of the State of Missouri was well above normal during June. The ground became saturated by midmonth and by the end of June runoff was excessive. Heavy rainfall continued the entire period after the 22d. Flooding became general when 3 to 4 inches of rain occurred in less than 24 hours. Flooding was the most severe in the northwestern quadrant where nearly 200,000 acres of farmland were flooded and damages were estimated at over $13 million.

Ohio Basin.--Locally heavy thundershowers caused some overflow of small creeks in Boone and Raleigh Counties in West Virginia in the Coal River Drainage during June.

Excessive rainfall in a matter of a few hours on the 23d caused flash flooding on the Barren River at Bowling Green, Ky., on the 24-26th. The crest on the 24th was 13.8 ft. above flood stage. Discharge ratings on the upper Barren River were reported as the greatest of record by the USGS and are regarded as greater than those likely to occur (on the average) once in 50 years. Several feeder streams which flow northward into the Barren River, such as Big Trammel and Little Tramell Creeks in northern Sumner County were flooded. Flood damage in Macon and surrounding counties was the result of rampaging small feeder streams, most of which flow northward into the Barren River.

Damaging flooding occurred in extreme northern Tennessee from torrential rains on the 23d. Rainfall reports (unofficial) were estimated at about 10 inches in the Salt Lick Creek Basin in the southern part of Red Boiling Springs. Torrential rains during a 6-hour period exceeded the estimated 6-hour, 50-year storm total at most places in the immediate storm area. Rain continued most of the night and before dawn on the 23d, Salt Lick Creek emptied such a torrent, that a wall of water 5 to 7 feet in height came swirling and crushing through the town. Houses, automobiles, street pavement, and small buildings were swept downstream like children's toys in a drainage ditch. The water was still 3 to 4 feet higher than most bridges remaining in Boiling Springs. By about midday, most of the water had receded. Property damage in Red Boiling Springs was estimated in excess of $2 million.

Minor flooding occurred on the White River at Anderson, Ind., on the 25th. The Skillet Fork at Wayne City, Ill., crested 3.2 ft. above flood stage on the 24th.

Heavy rain on the 22d to the 24th caused some flash flooding of the smaller tributaries of the Cumberland River in the North Springs, Tenn., area. The Red River at Port Royal, Tenn., crested 0.2 foot below flood stage on the 25th. Damage was light and confined to farmlands.

Rainfall, averaging 4 inches in the headwaters of the French Broad River late on the 15th and early on the 16th, caused minor flooding at Rosman, N. C. The crest on the 15th was 1.6 ft. above flood stage. No flooding occurred at downstream points.

Arkansas Basin.--Light to moderate flooding occurred on the Whitewater and Walnut Rivers in Kansas on the 24th and 25th. The first flooding since August 1968 occurred on the Chikaskia River at Blackwell, Okla., on the 24-26th. The Cimarron River at Dover, Okla., reached bankfull stage on the 18th. Bird Creek crested about 10 feet above flood stage at Avant, Okla. This was the highest stage reported at this point since September 1961. Downstream the crests ranged from 1 1/2 to 3 ft. above flood stage. Brief flash flooding occurred on Red Rock Creek west of Red Rock, Okla., on the 18th.

The Dunlap-Bushong, Kans., area in the upper Neosho Basin and the Elk-Diamond Springs area in the Cottonwood Basin are part of a 4-county area in which several unofficial 10-inch rains were reported during the evening of the 26th. The resulting flooding extended downstream to John Redmond Reservoir and was rather extensive and locally severe. Damages along the Little Caney and Caney Rivers were estimated at $85,000 and along Bird Creek at $44,000.

Heavy rains in the Texas and Oklahoma Panhandles early on the morning of the 11th caused the North Canadian River to rise above flood stage at Woodward, Okla., on the 12th and at Seiling, Okla., on the 13th. The crests on the 13th and 14th were 1.3 and 1.0 ft., above flood stage. No significant damages occurred from the bottomland flooding. Heavy thunderstorms moving across southwestern and central Oklahoma during the night of the 13-14th caused brief local flooding of some small creeks and tributaries.

Minor flooding occurred along the main stem of the Arkansas River in the reach from Arkansas City, Kans., to Ralston, Okla., a distance of 108 miles. Damages, if any, were insignificant.

Red Basin.--Two- to 3-inch rains over the Ouachita Basin on the 1st and 2d caused minor flooding at Arkadelphia, Ark., on the 2d. No damage resulted from the overflow.

WEST GULF OF MEXICO DRAINAGE

The Sabine River receded within its banks in the reach from Mineola to Longview, Tex., on June 2-5.

Minor flooding occurred on the Neches River at Beaumont, Tex., on the 1st and again on the 4th to the 13th. The crest on the 9th was 0.5 ft. above flood stage.

Flooding on the lower Trinity at Liberty, Tex., continued from May 7 to June 11. The crest on May 27 was nearly 5 feet above flood stage. At Moss Bluff, Tex., the Trinity continued in flood from Feb. 21 to June 27. The highest crest (4.2 ft. above flood stage) occurred on May 28-30.

The San Jacinto continued over the top of the spillway at Lake Houston, Tex., from Dec. 1 to June 16. The highest crest (2.2 ft. above the spillway) occurred on Feb. 23. The crest during June was 0.25 foot above spillway elevation on the 5th and 6th.

Heavy rains up to 6 inches on the 2d to the 3d caused extensive flooding on Turkey Creek above Crystal City, Tex., and minor flooding below. Chapparosa Creek, a tributary of Turkey Creek, was reported highest in several years. Minor damage was caused by soil erosion and breaks on terraces.

Great Basin.--Following one of the driest springs (March-May) of record, June, in sharp contrast, was exceptionally wet from the Rocky Mountains westward across the Great Basin, including the northern mountains in New Mexico and Arizona. In northern Utah, 10 stations reported maximum June monthly totals (some with nearly 100 years of record) and several more were the second wettest.

Heavy rain (0.90 inch in 30 minutes) in downtown Salt Lake City on the 16th caused street flooding as drainage systems could not handle the runoff. Traffic was halted briefly and a few business houses and basements were flooded. No damage of any consequence was reported.

Minor flooding occurred on Grove and Battle Creek east of Pleasant Grove, Utah, on the 17th. Some damages resulted to roads and one residence.

PACIFIC SLOPE DRAINAGE

The San Joaquin River at Vernalis, Calif., was one foot above danger level on June 1. It continued to rise during the month, cresting 1.4 ft. above danger level on the 11th. The river dropped below the danger level on the 16th and by the end of the month was 6 ft. below this level. The levee breaks on the Stanislaus River continued to cause flooding of Reclamation District 2031, but the flooded area decreased as the river fell.

A considerable portion of Sherman Island remained under water at month's end with evaporation gaining on the pumps at removing water from this area. Some planting has been done on the dry portion of the island. Replanting of orchards and asparagus will await complete drying out of the island. Bypass islands are back to normal farm operations.

Severe thunderstorms in the Cascade Mountain areas in Oregon on the evening of the 4th caused flash flooding. The town of Ashland, Oreg., suffered the greatest damage in the form of mud and rock-filled streets, flooded stores, flooded streets, downed trees, disrupted communications, and loss of power.

Hot, dry weather during the first 3 weeks of June caused significant snowmelt runoff in the northern Columbia Basin. The Kootenai River at Bonners Ferry, Idaho, crested at 30.15 ft. (flood stage, 31 ft.) on the 8th, exceeding the previous high of 29.9 ft. recorded on May 25. Other tributary streams which equalled or exceeded peak flows recorded a month earlier were Lake Chelan on the 5th and Wenatchee River at Peshastin, Wash., on the 6th.

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G.C.T.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun. JUNE 1969

D Dust
* Values corresponding to true solar noon
DS Slight dust
HS Slight haze

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

U Indicates Urban sites.

The solar radiation data in this table form the basis for the analyses in Charts VII, A, and B, of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska

JUNE 1969

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	268	261	212	119	132	231	230	35	66	206	217	257	227	294	255	173	145	246	252	204	201	193	176	212	107	203	210	192	215	219		199

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the ESSA, Weather Bureau.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (< 3900 Å) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	15.03	16.33	25.69	17.99	23.79	15.15	7.45	24.27	25.10	23.32	18.70	8.28	25.57	13.73	22.37	21.31	18.23	19.41	14.32	21.19	20.00	10.30	8.05	15.74	6.74	6.86	24.03	8.64	13.73	14.56		16.86

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the ESSA, Weather Bureau.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code ,s ϱ ϱ ϱ defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

page 99: Seattle-Tacoma, Wash. — Solar radiation total for the 17th should be 181 and the average 164.

Month: March 1969

page 139: Wyoming — There was no occurence of storms or unusual weather phenomena.

page 155: Salt Lake City, Utah — Solar radiation average should be 461.

Month: April 1969

page 240: Lihue Kauai, Hawaii — The 5 mb. height should be 35,901 m.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys. DELAYED DATA

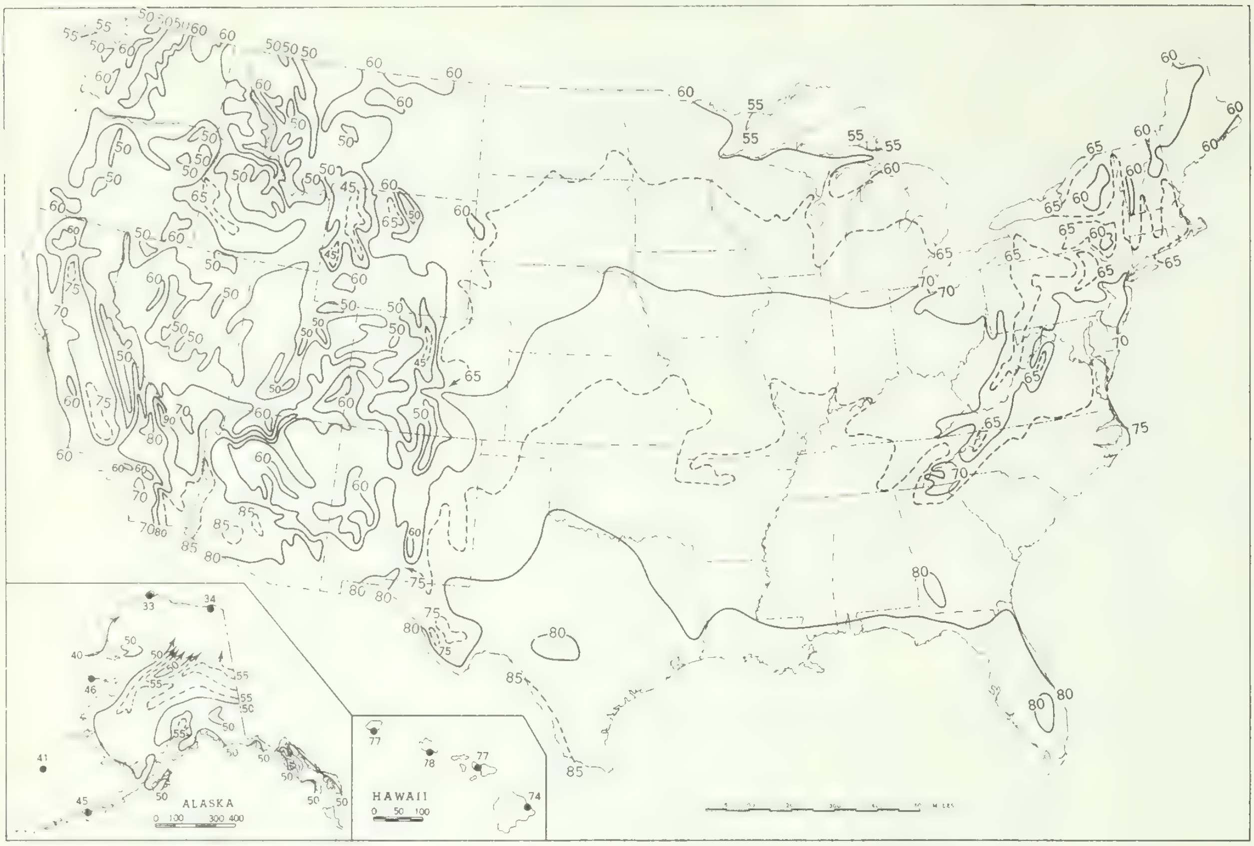
Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), June.



B. Temperature Departure from 30 - Year Mean (°F 1931-60), June 1969.

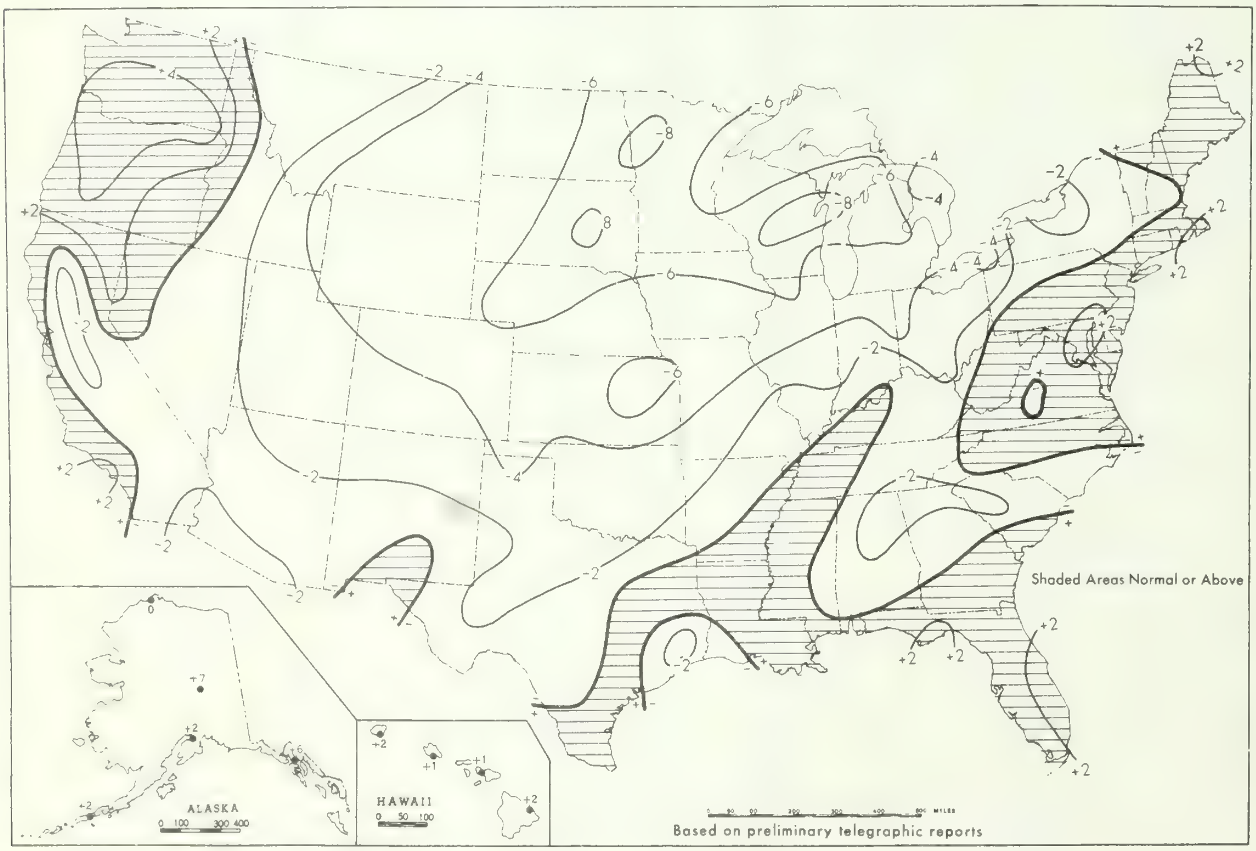


Chart II. Total Precipitation (Inches), June 1969.

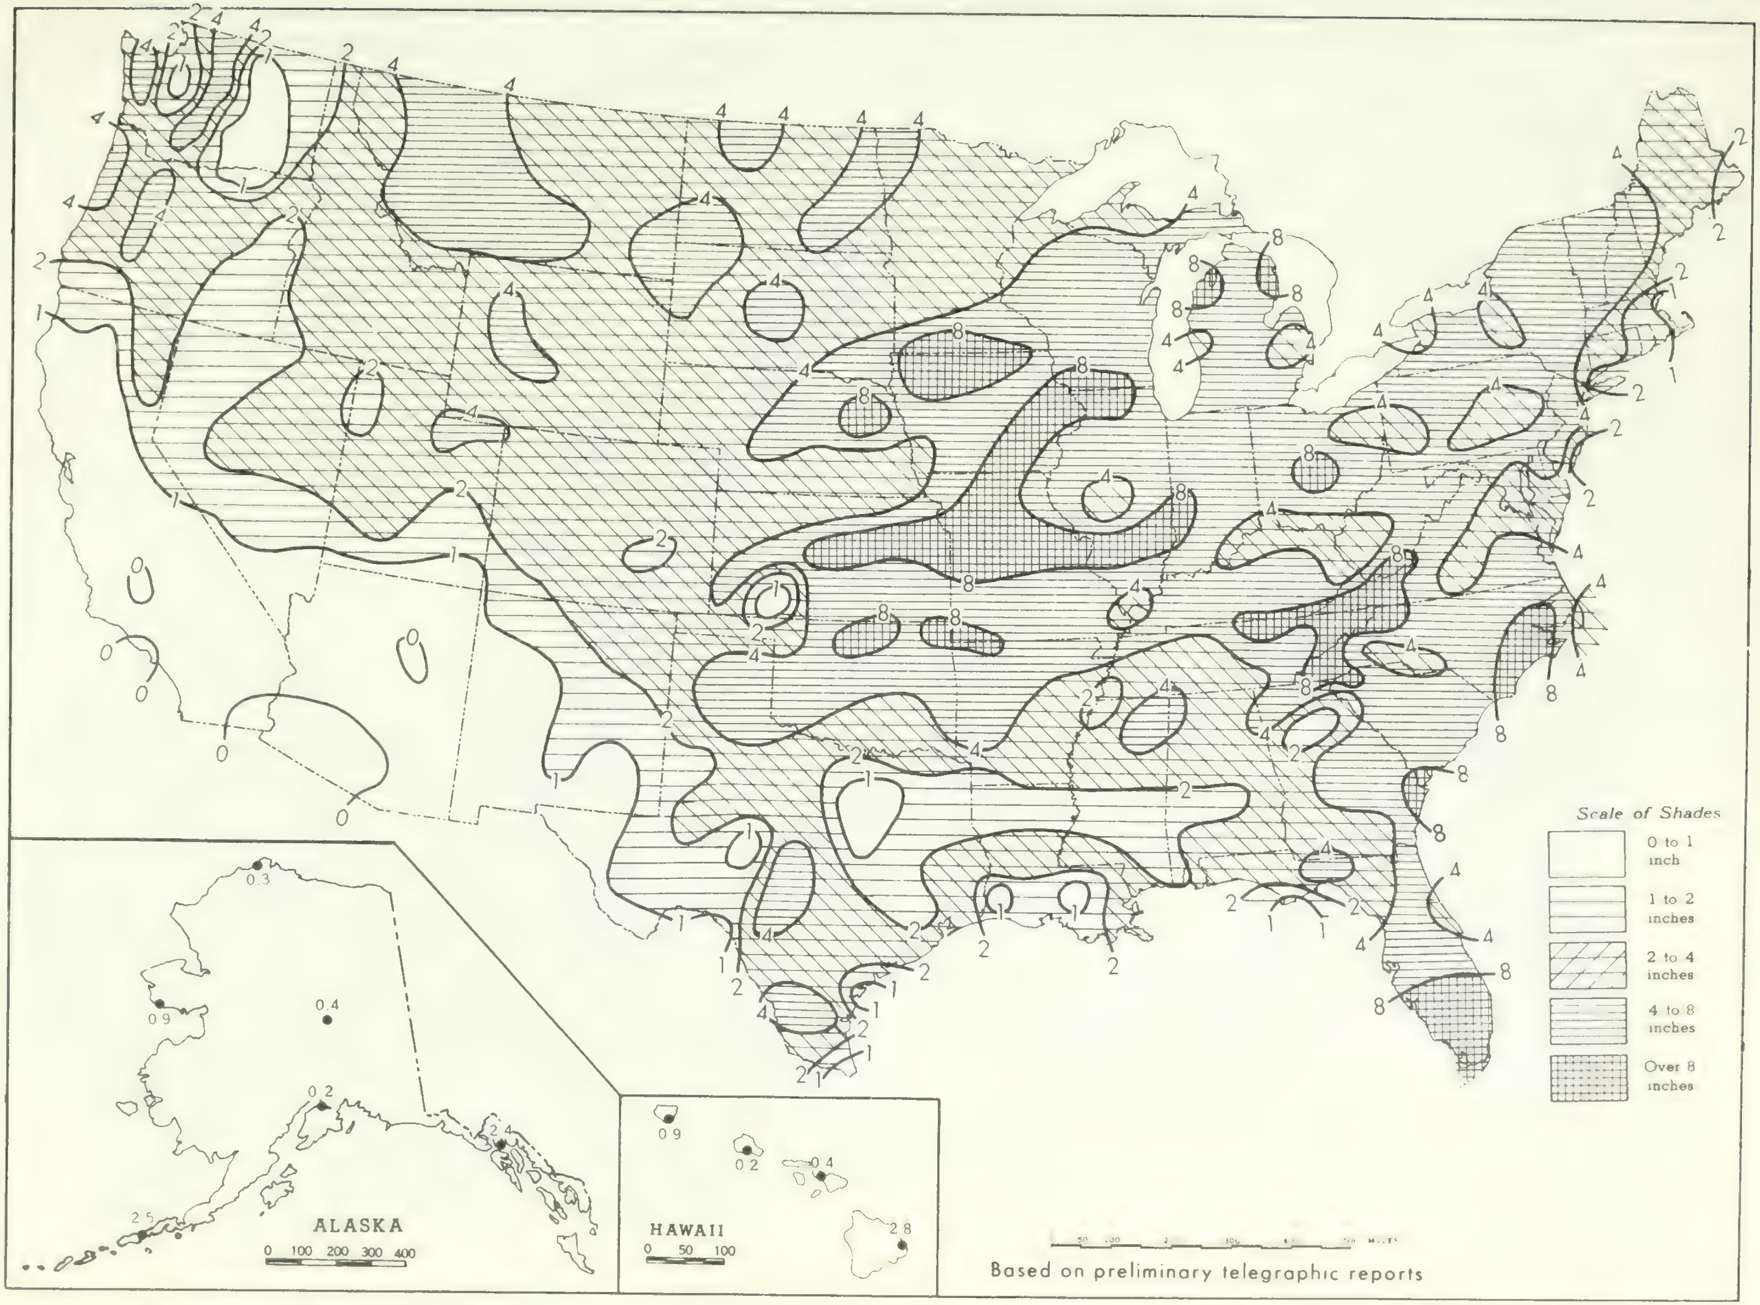

Chart III. Percentage of Normal Precipitation, June 1969.

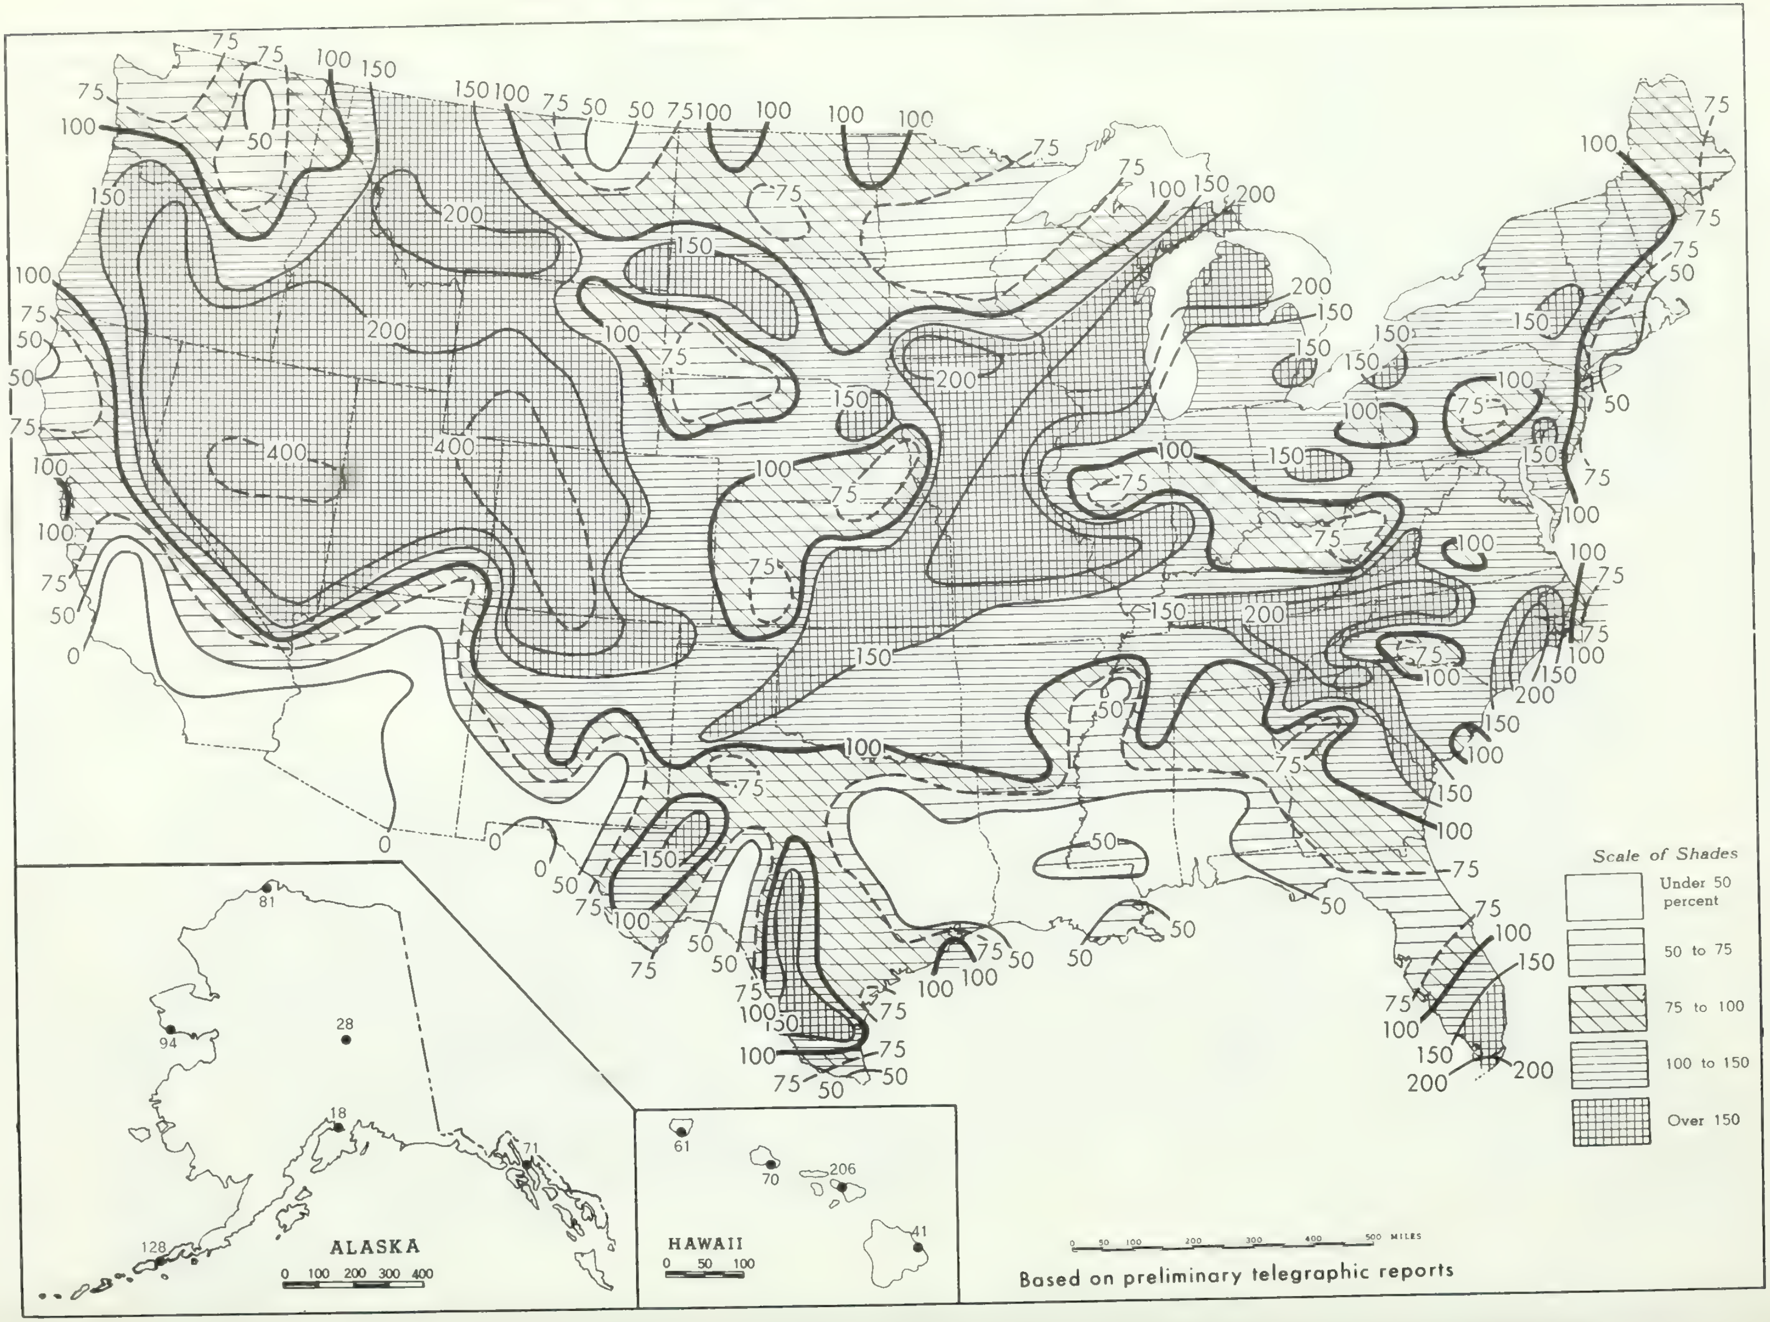

Chart VI. A. Percentage of Possible Sunshine, June 1969.

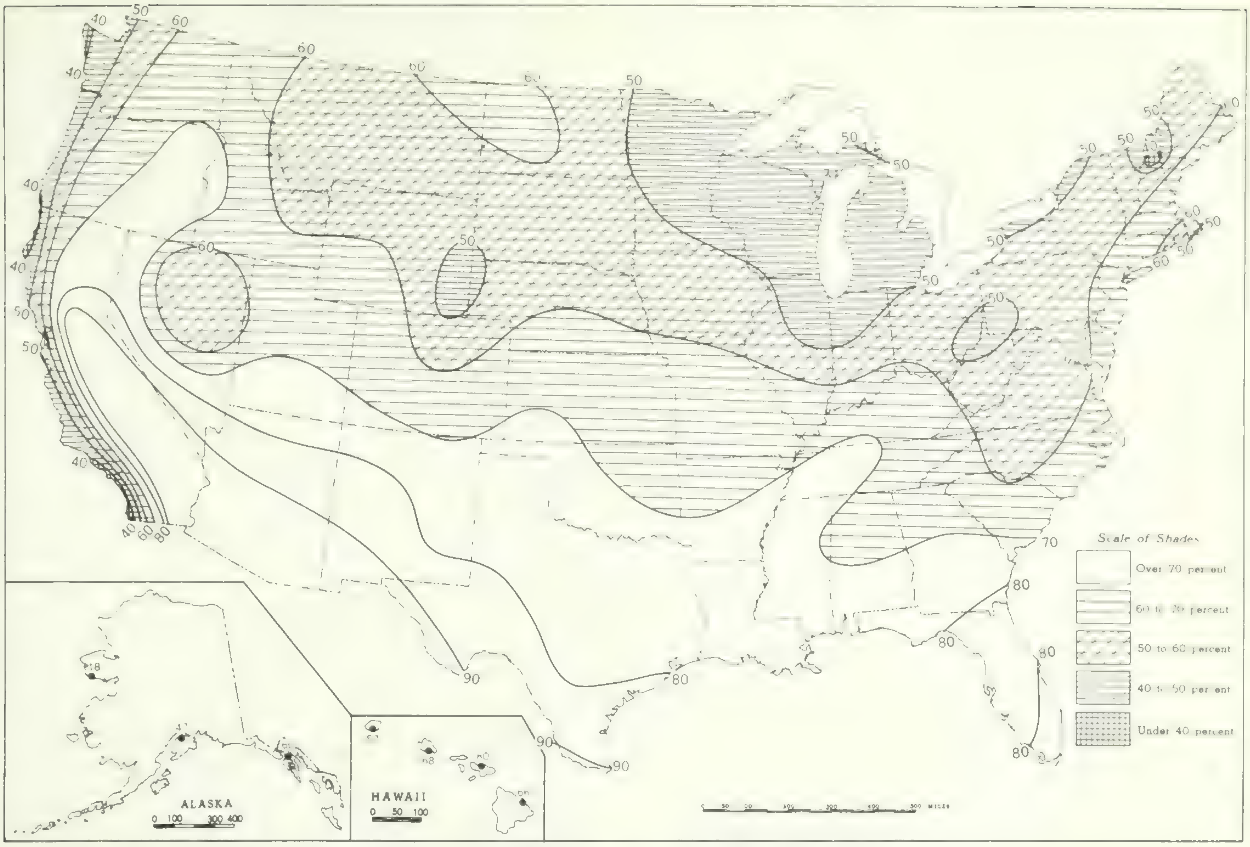
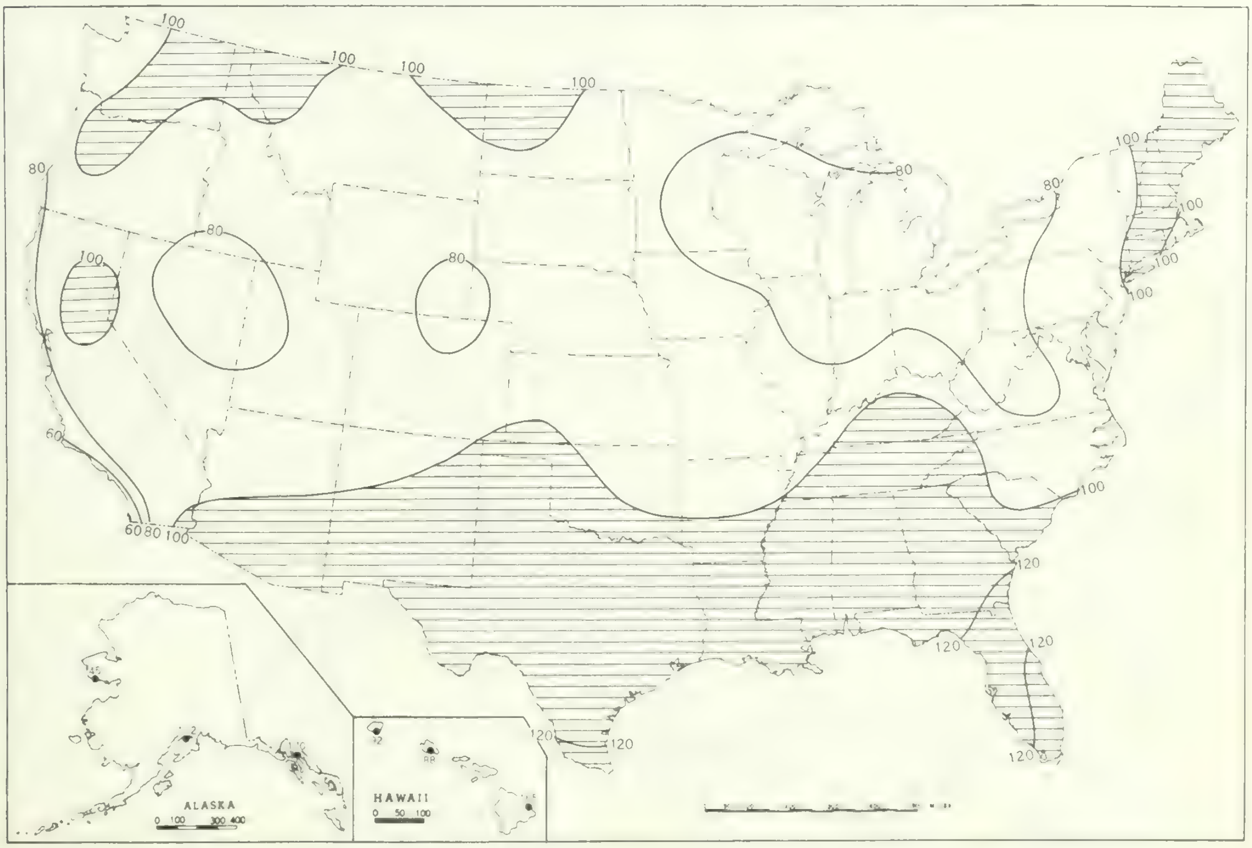
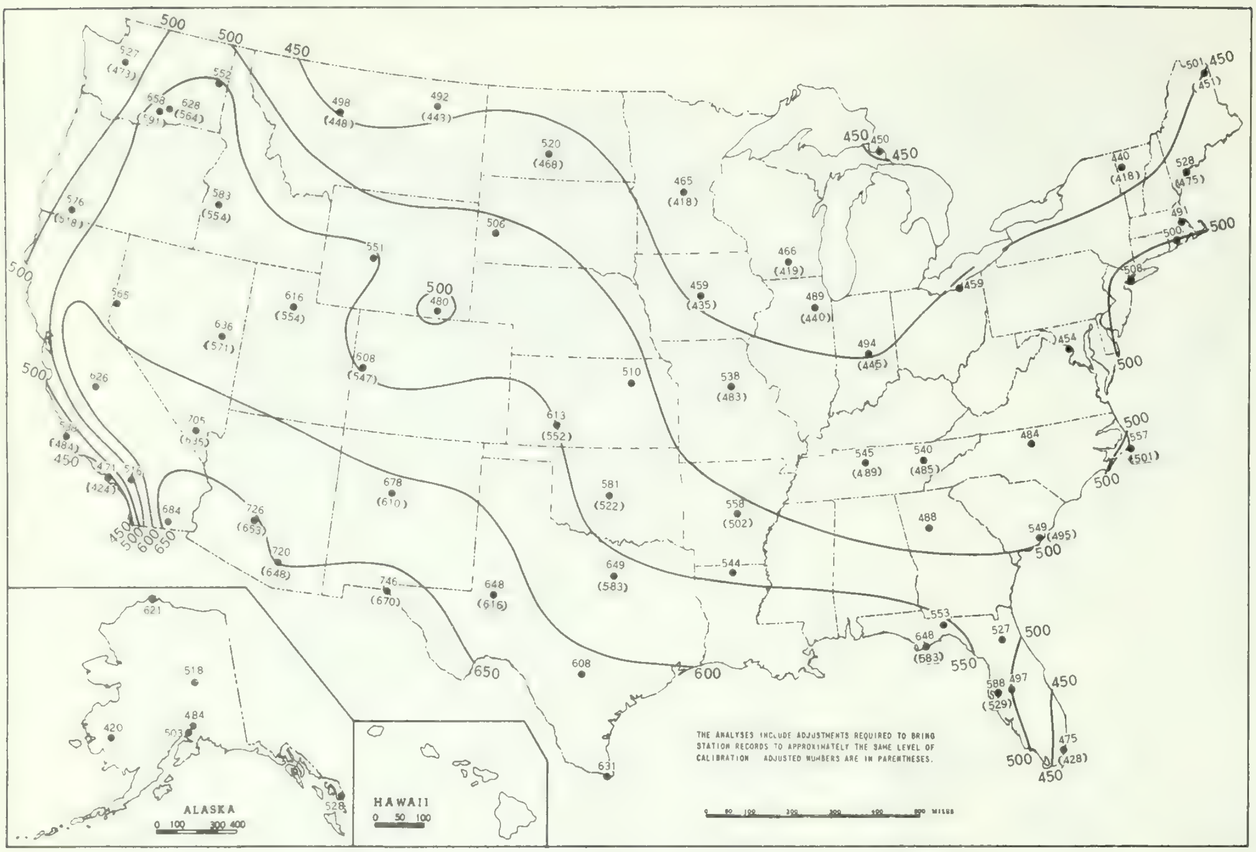


B. Percentage of Mean Monthly Sunshine, June 1969.

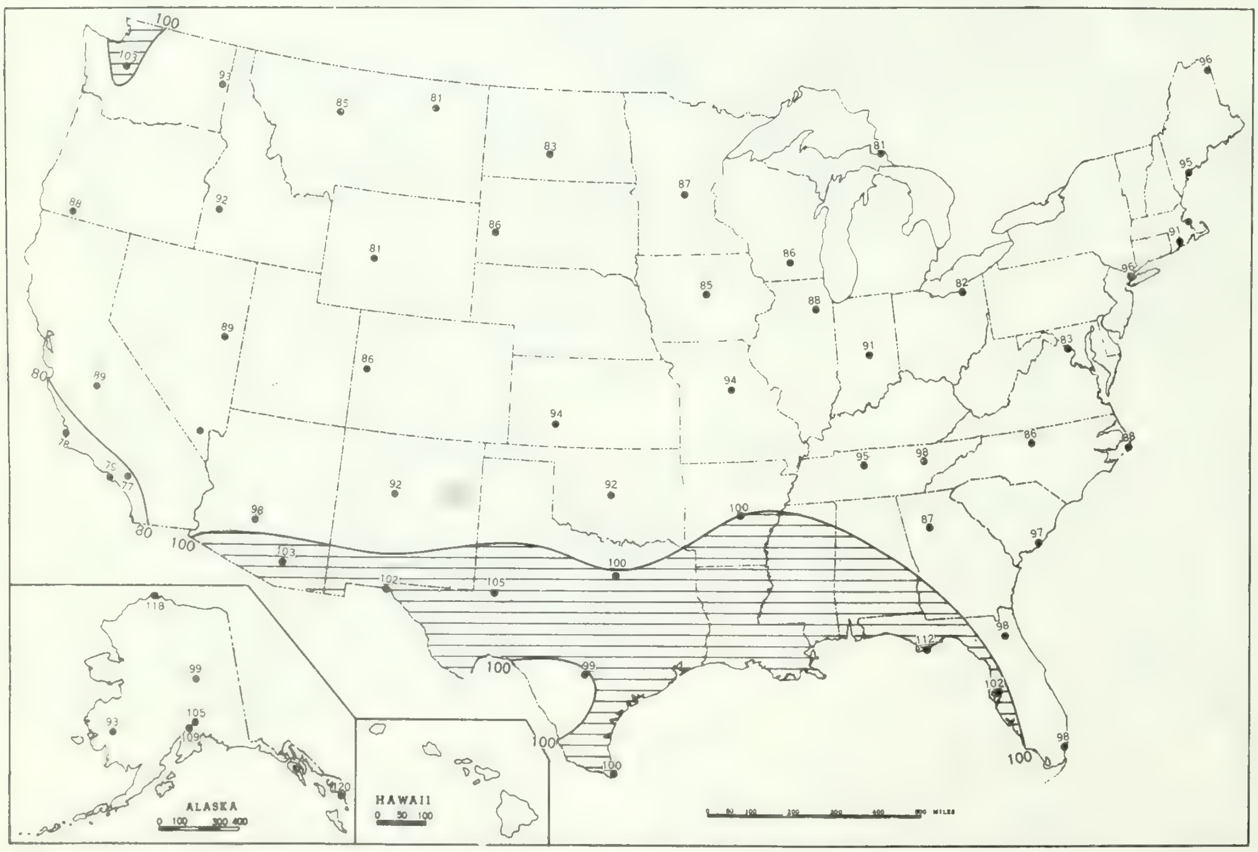


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, June 1969.

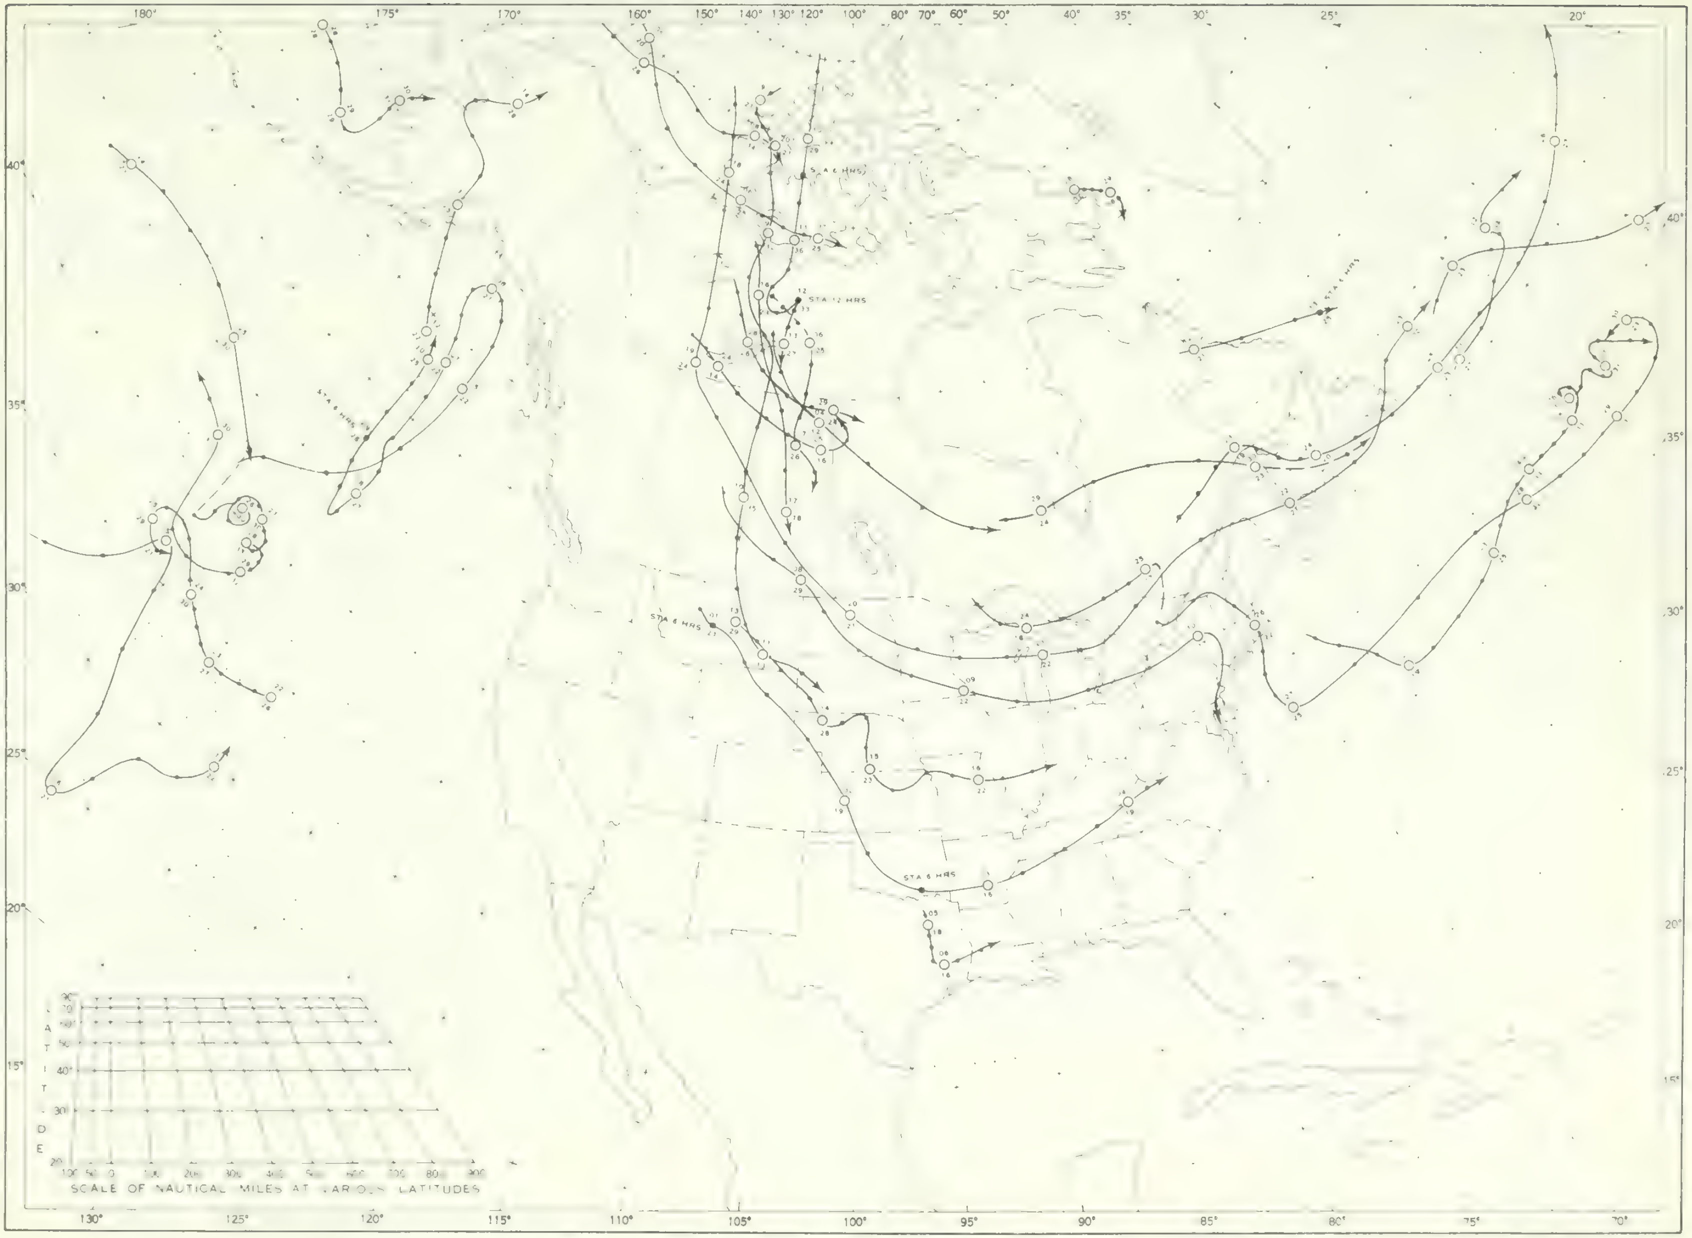


B. Percentage of Mean Daily Solar Radiation, June 1969.



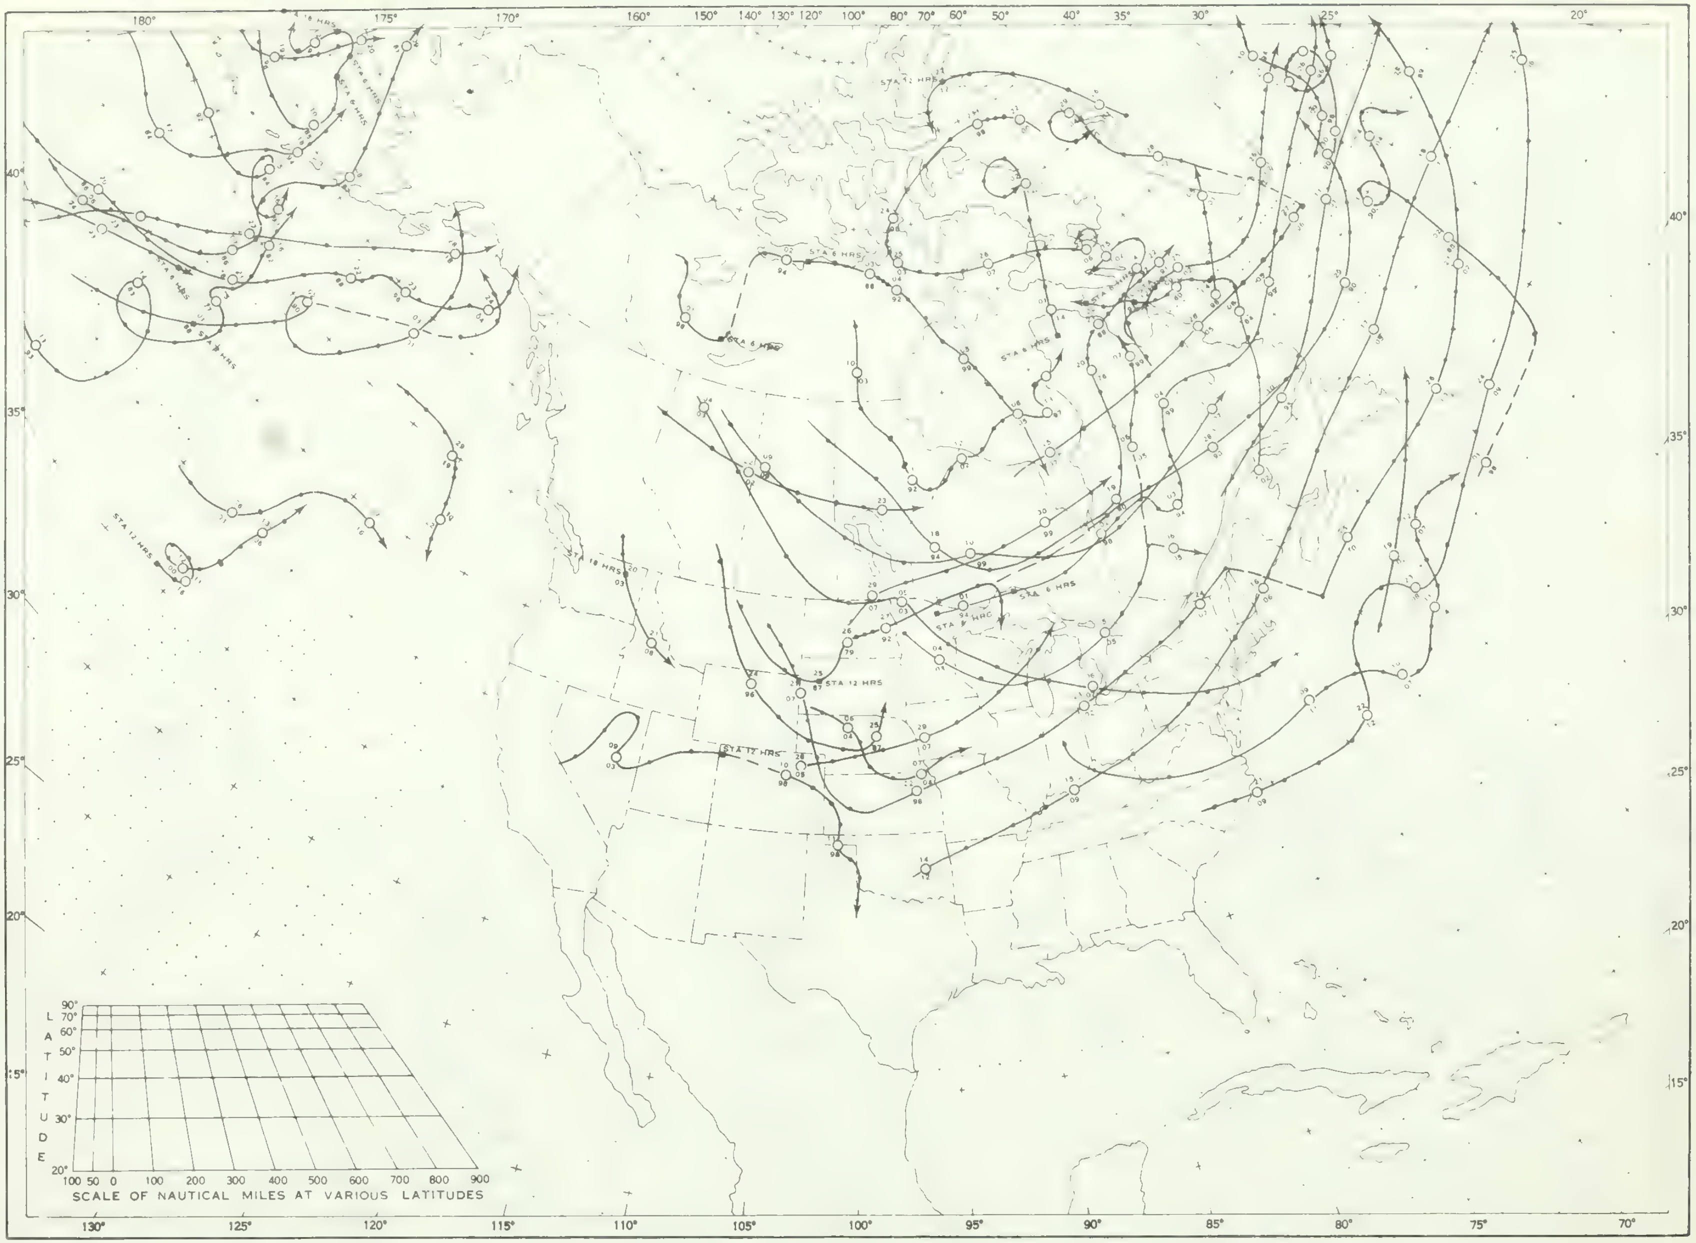
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, June 1969.



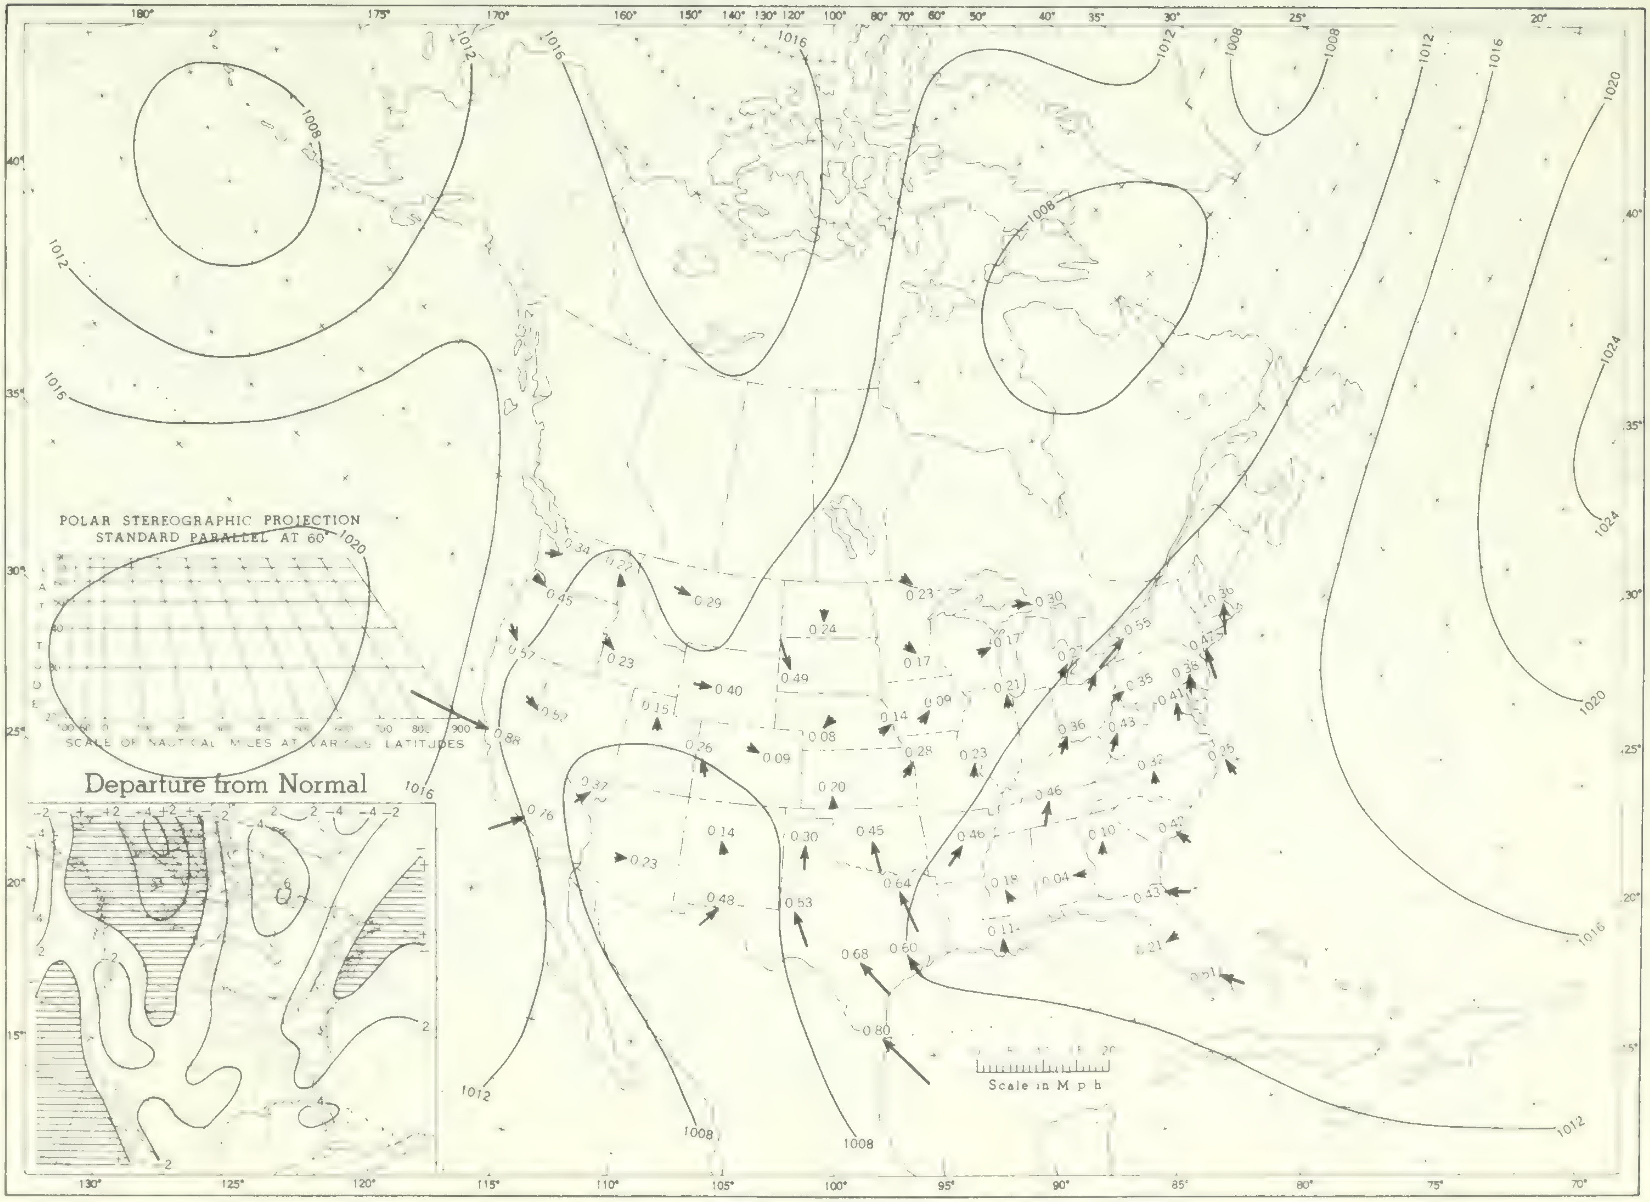
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX Tracks of Centers of Cyclones at Sea Level, June 1969.



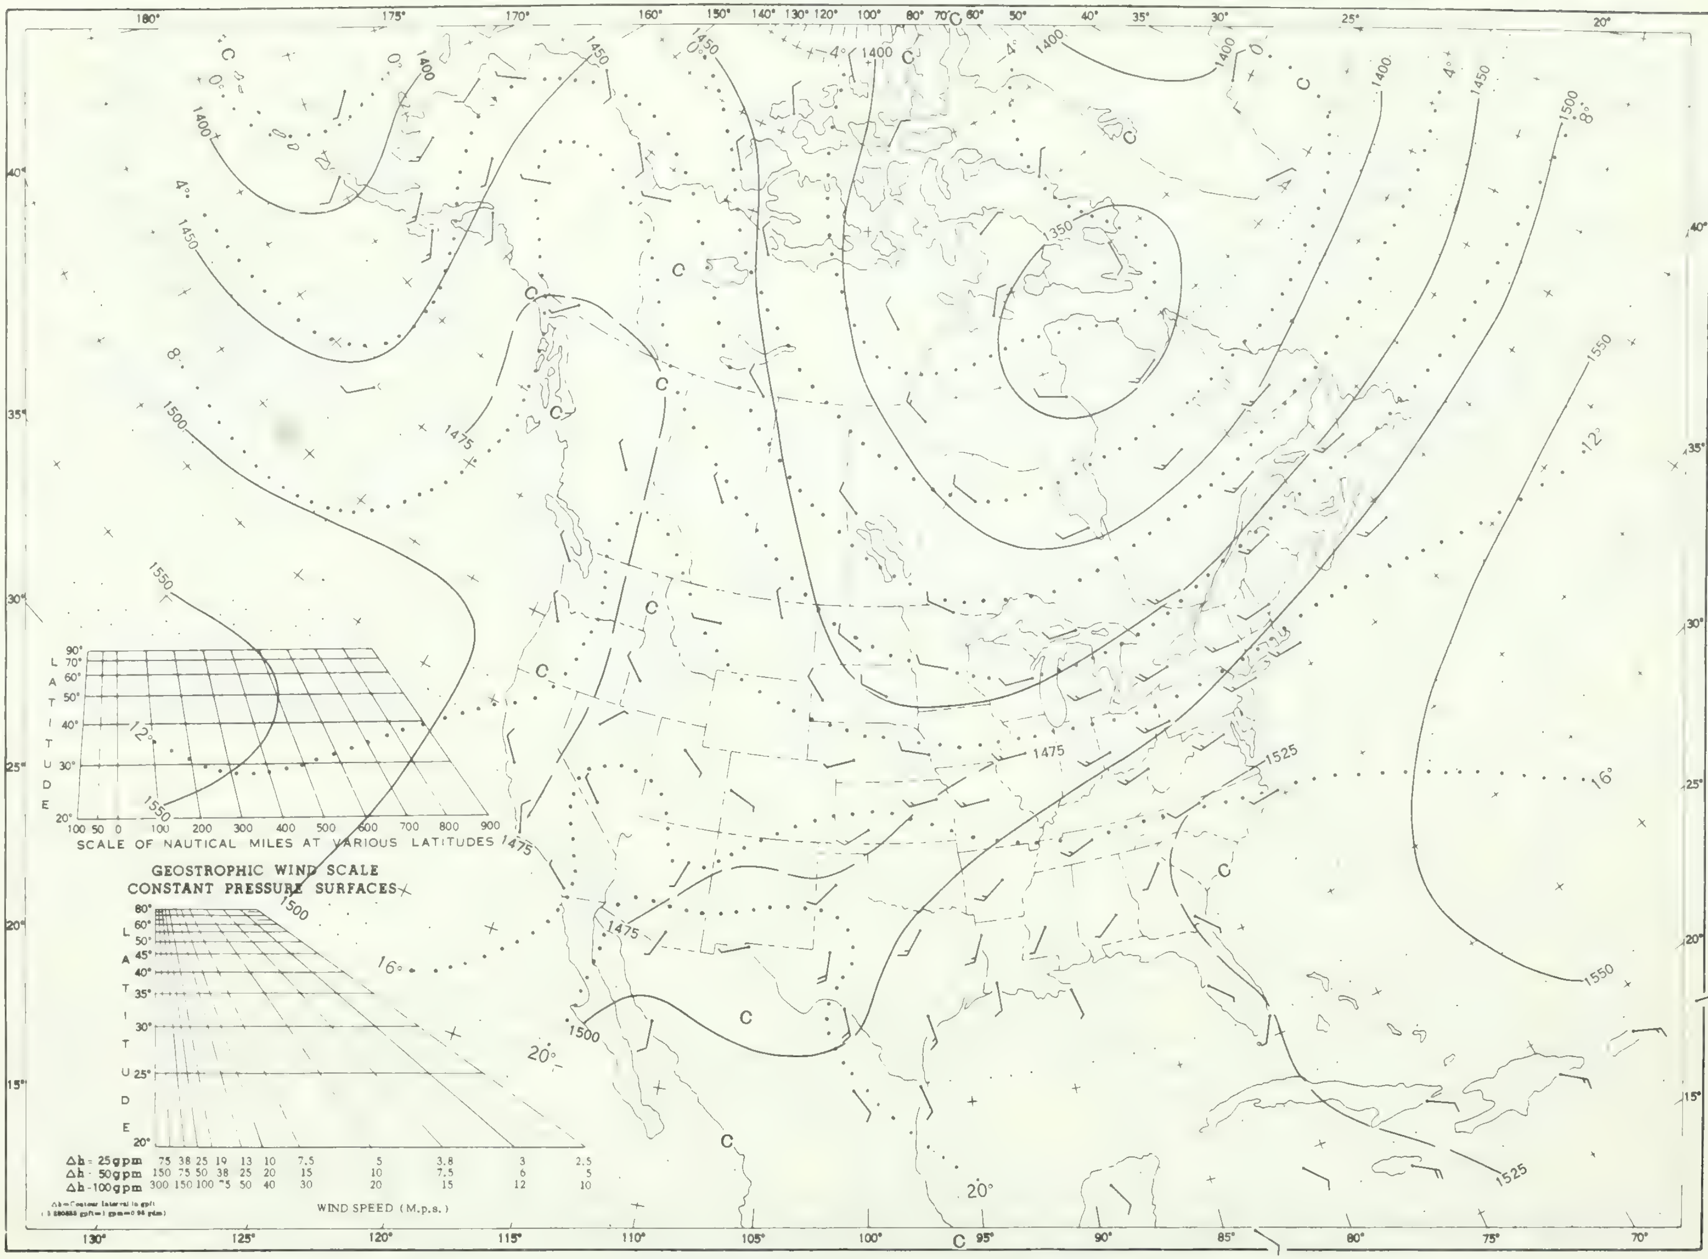
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, June 1969. Inset. Departure of Average Pressure (mb) from Normal, June 1969.



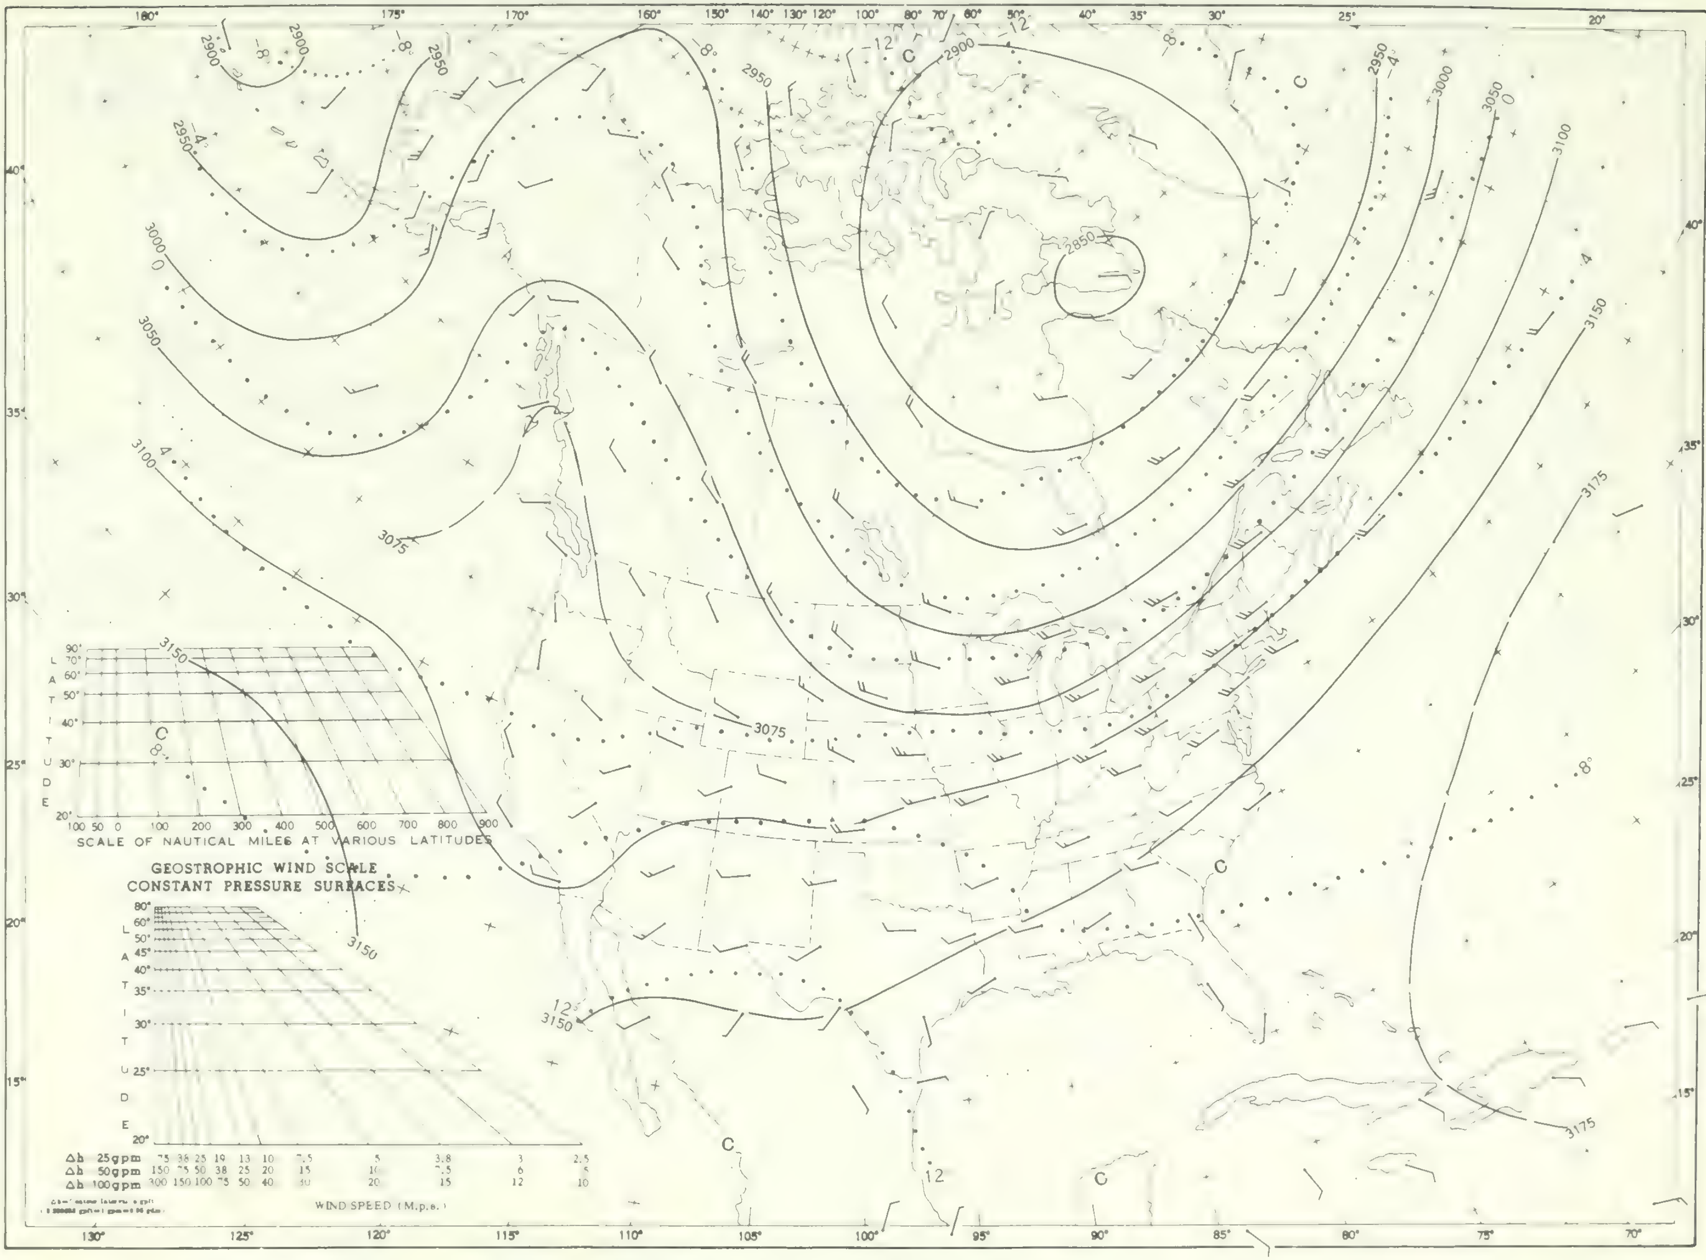
Average sea level pressures are obtained from eight daily 3 hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb Surface, 1200 GMT, June 1969. Average Height and Temperature, and Resultant Winds.



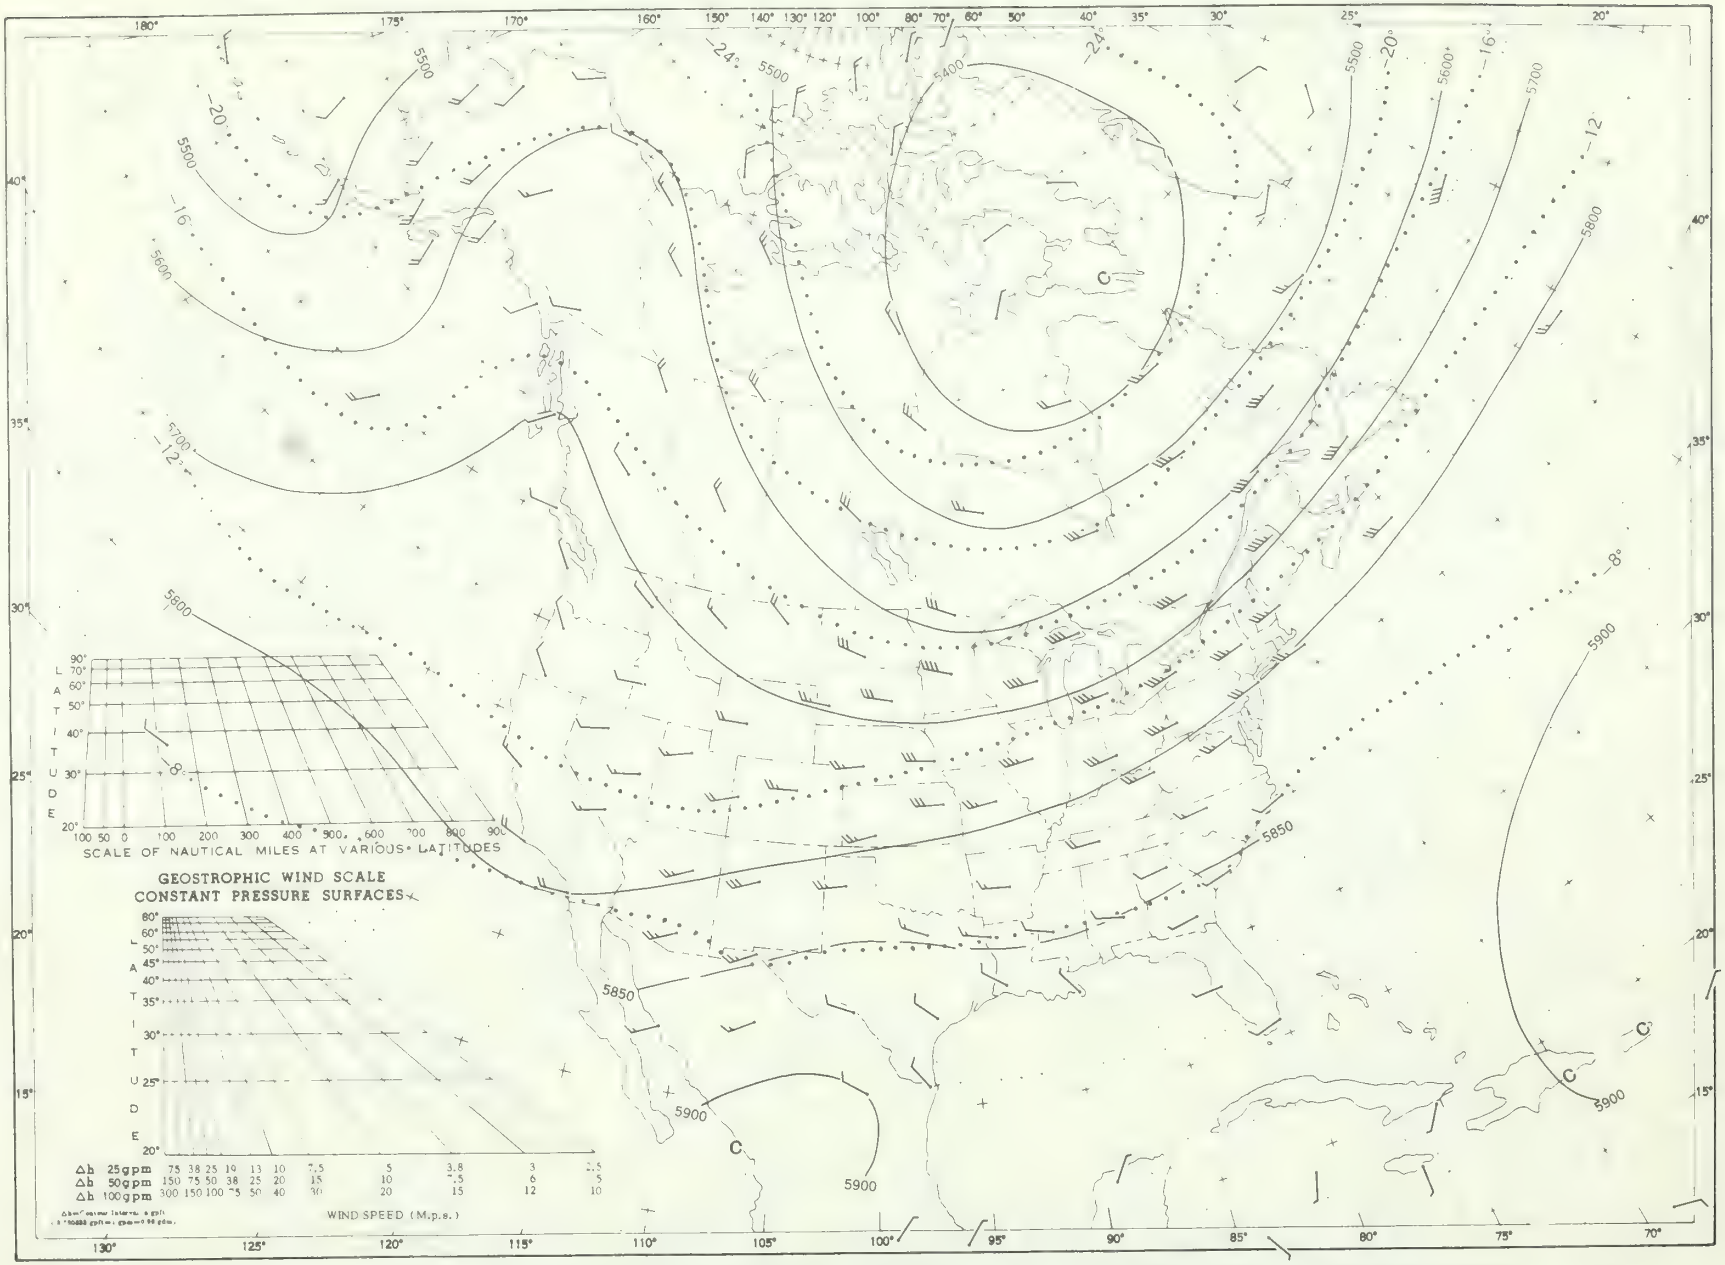
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII 700-mb Surface, 1200 GMT, June 1969. Average Height and Temperature, and Resultant Winds



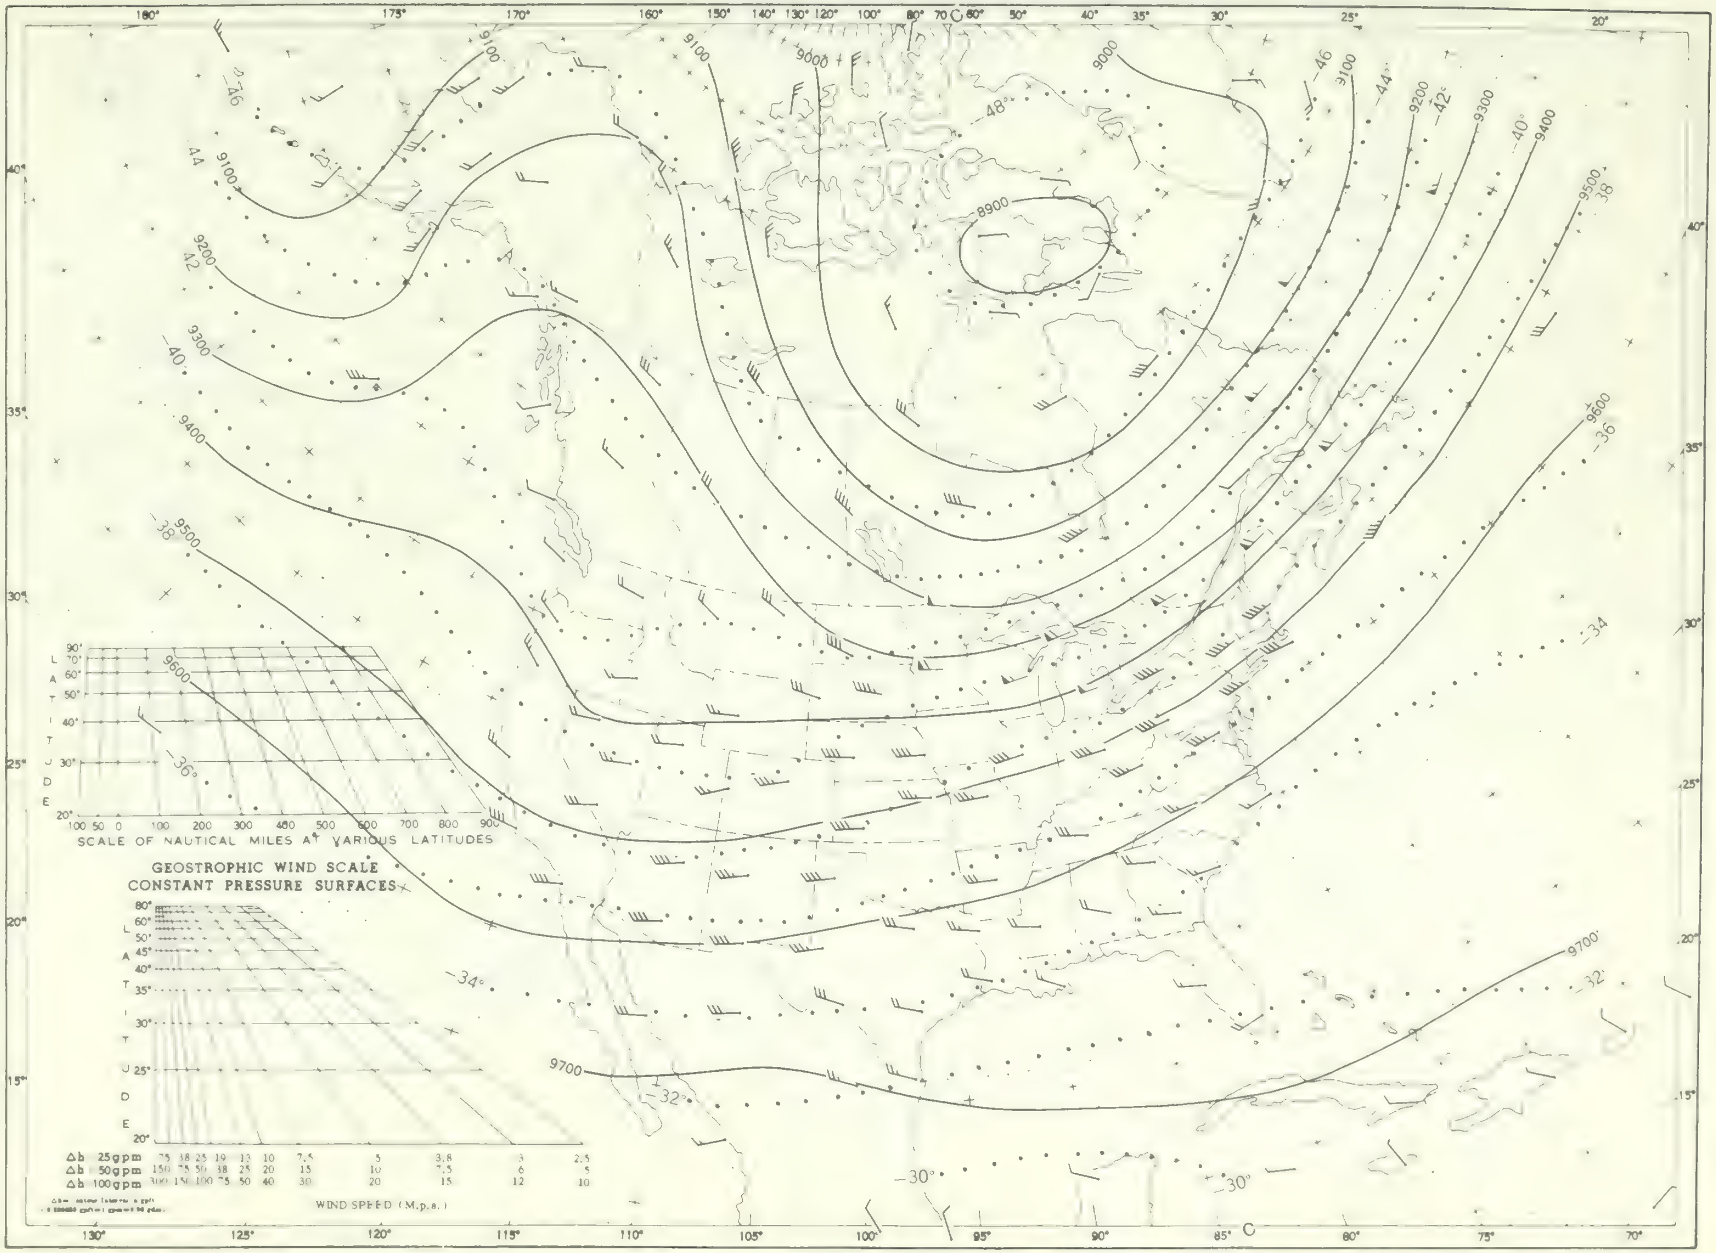
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII 500-mb Surface, 1200 GMT, June 1969. Average Height and Temperature, and Resultant Winds.



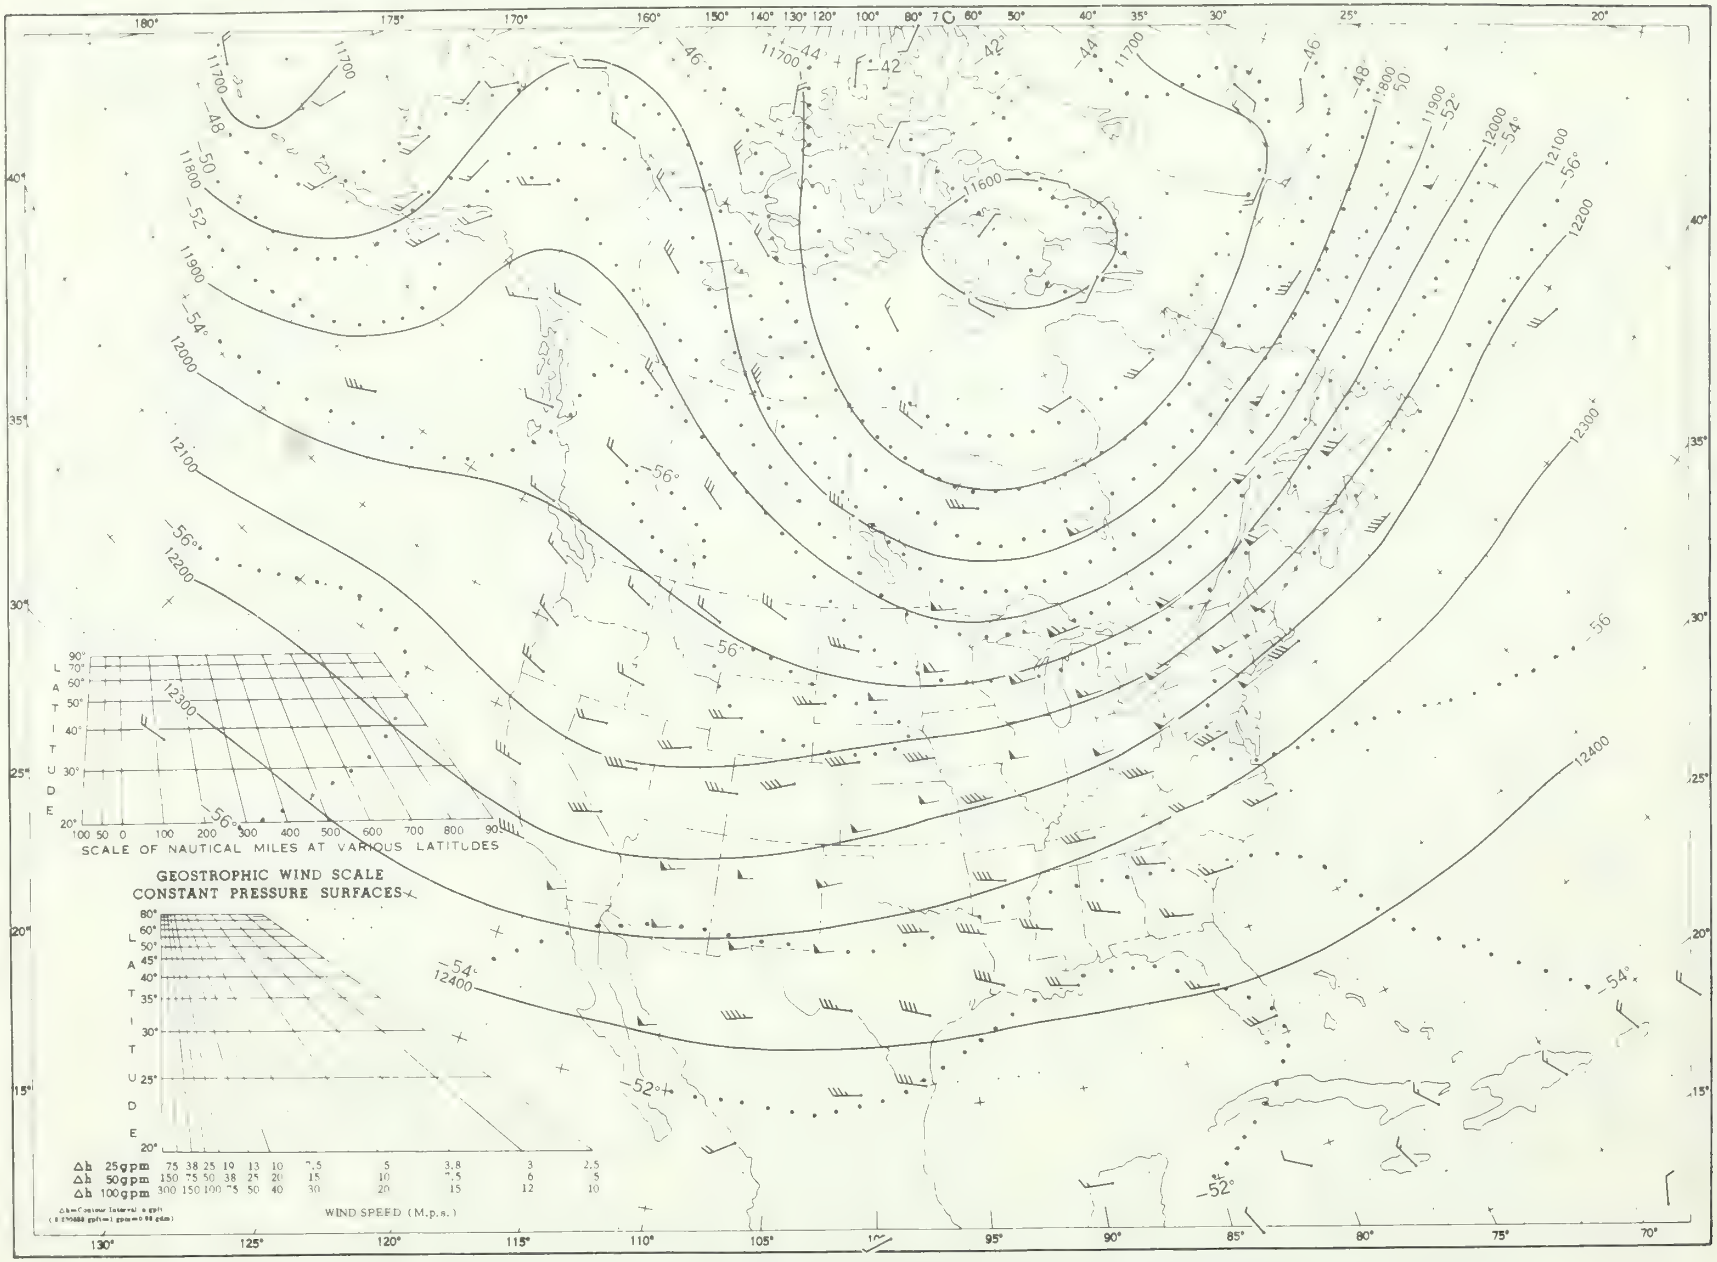
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 GMT, June 1969. Average Height and Temperature, and Resultant Winds.



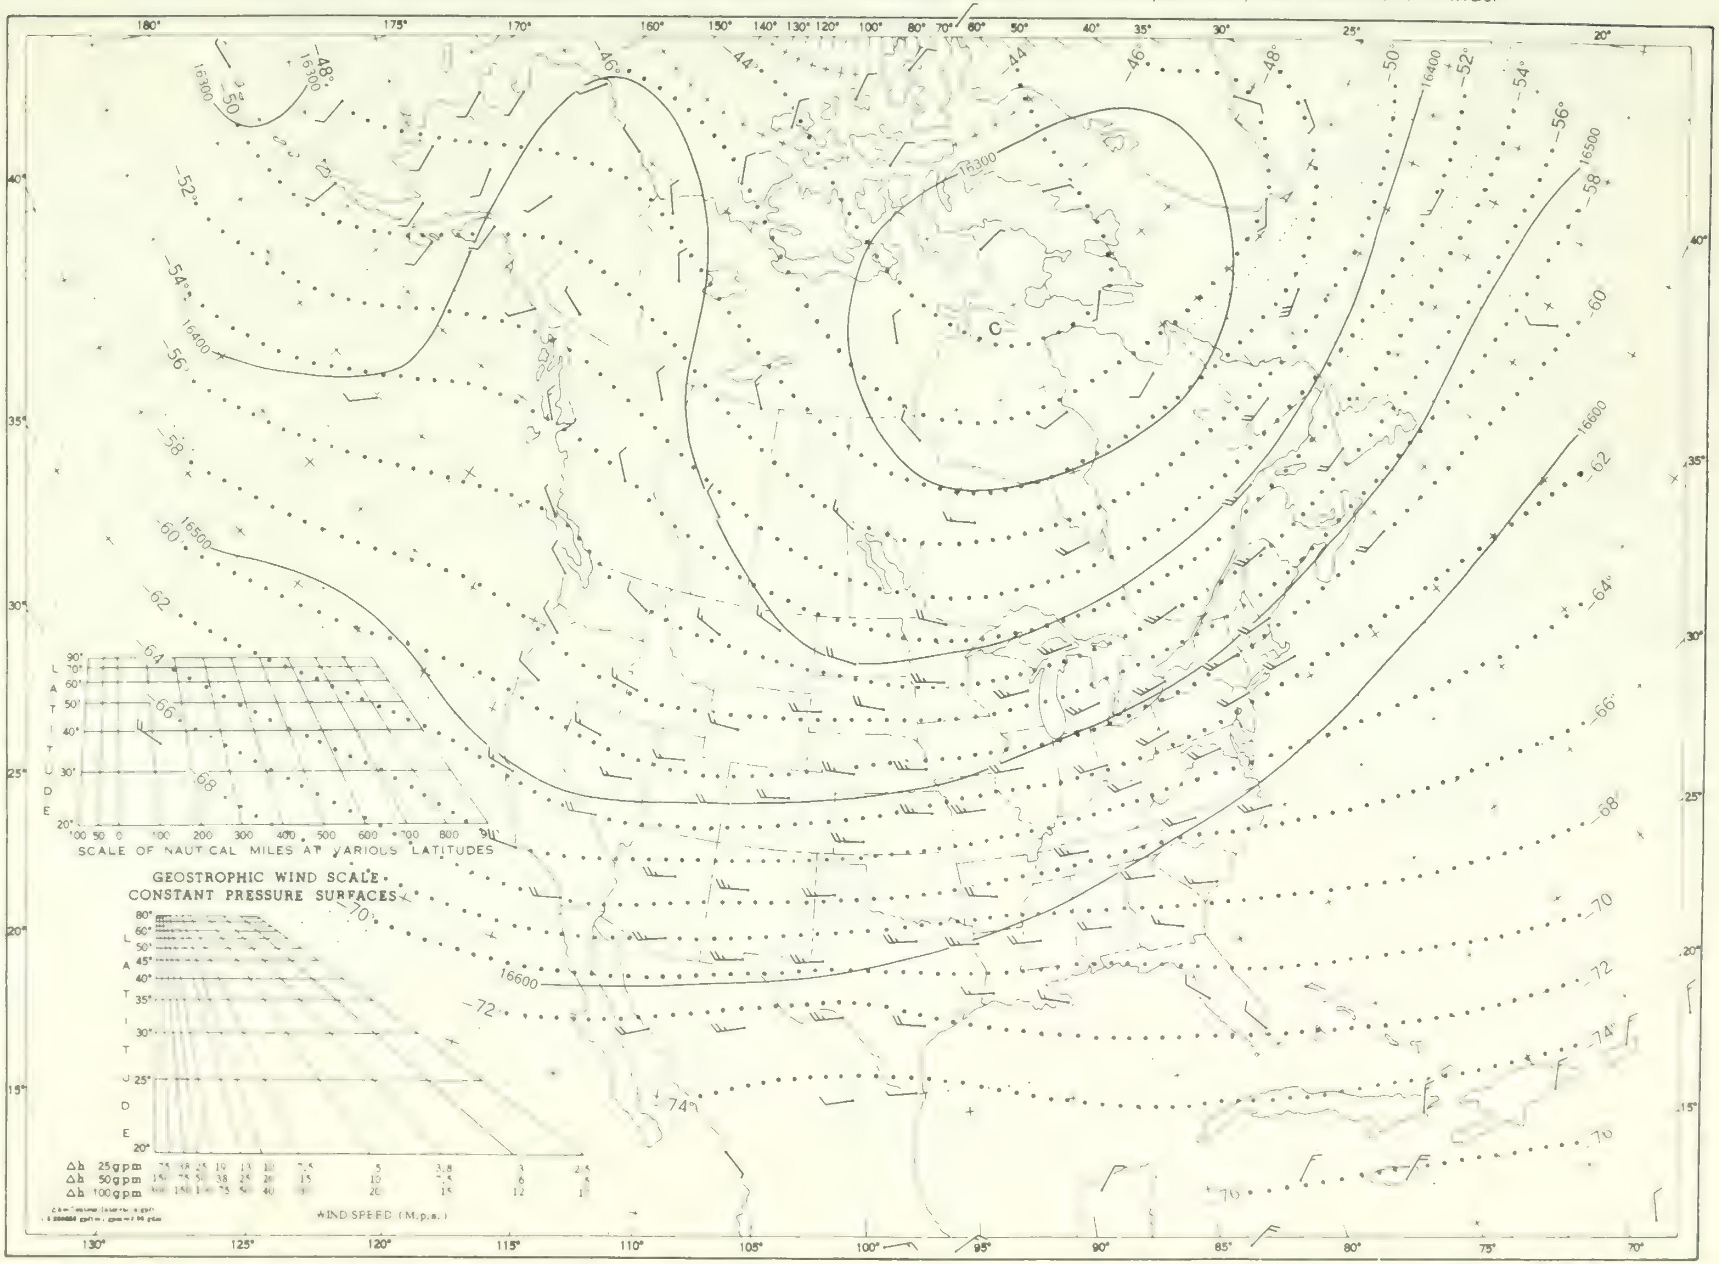
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV 200-mb Surface, 1200 GMT, June 1969. Average Height and Temperature, and Resultant Winds.



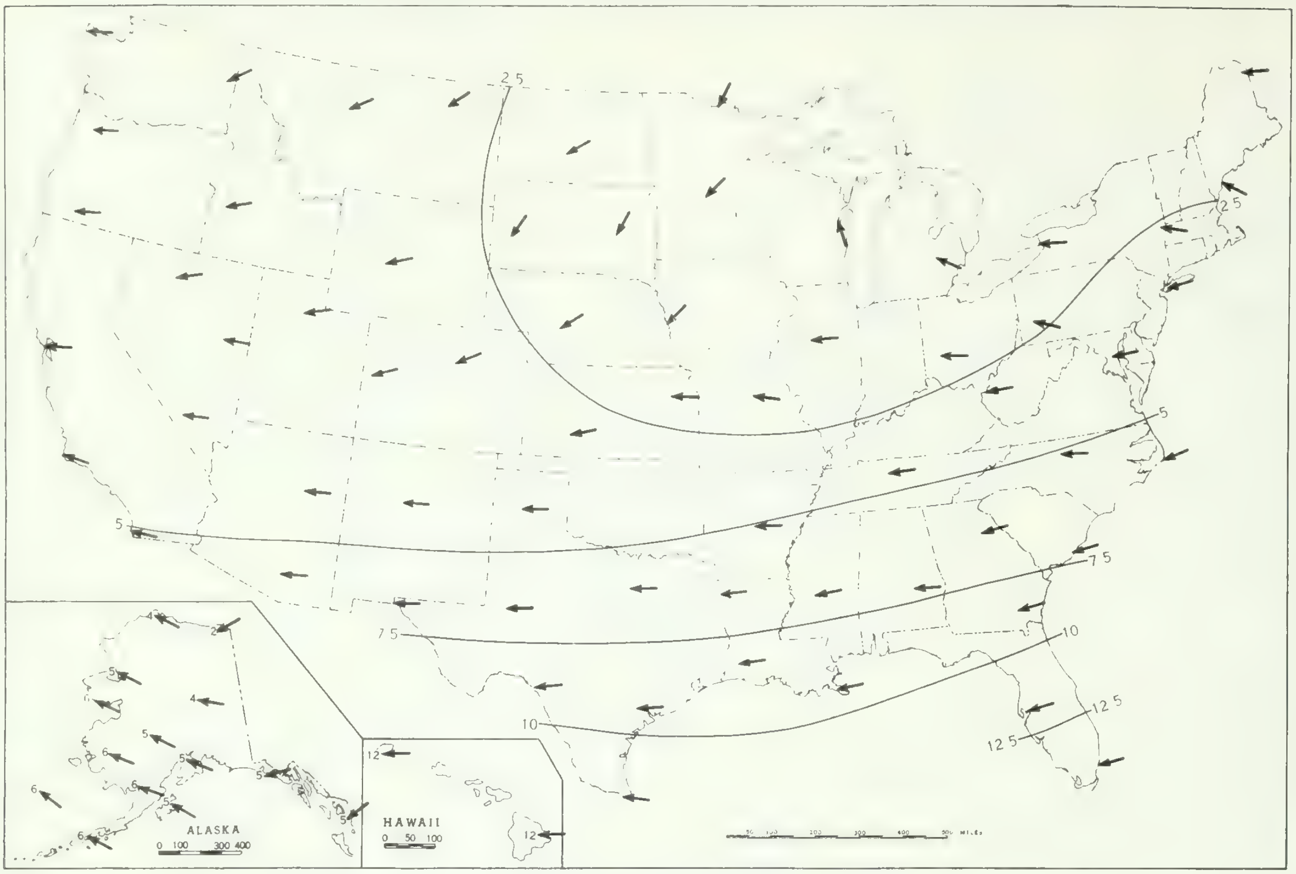
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 GMT, June 1969. Average Height and Temperature, and Resultant Winds.

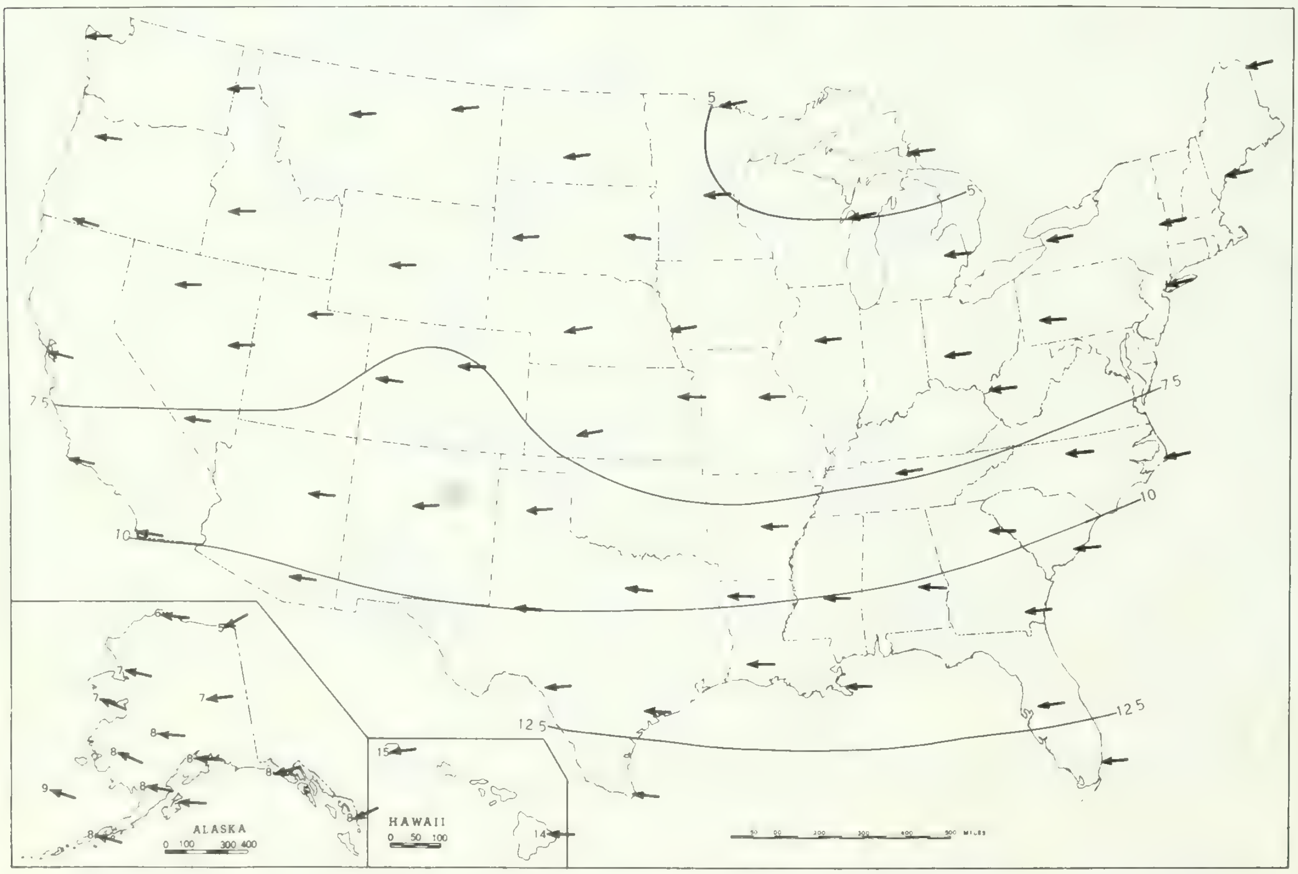


Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 GMT, June 1969. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, June 1969. Resultant Winds.



Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

NATIONAL SUMMARY

July 1969

Volume 20 No. 7

Asheville 1969

CONTENTS

NOTE: Delayed data and corrections will be carried in the June and December issues of this publication. An explanatory page "Description of Charts" will be carried in the January and July issues.

SUBSCRIPTION PRICE: Monthly 20 cents and annual 40 cents per copy; yearly subscription, including monthly and annual issues, $2.50 domestic, $3.50 foreign. Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to "Superintendent of Documents, Government Printing Office, Washington, D.C. 20402"

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 20 No. 7 JULY 1969

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. July 1969 was cooler than normal over the northern half of the Nation and warmer than normal over the southern half.
2. Heavy rains caused severe flooding and considerable damage in some eastern locations.
3. Many persons were killed and injured by the thunderstorms that struck northern Ohio on July 4-5.

TEMPERATURE.--July temperatures averaged below normal over the northern half of the Nation and above normal over the southern half. A number of stations in the South recorded the hottest July in several decades.

Heat and humidity over the southern States intensified in the first week of July. Needles, Calif., registered 115° or higher on several afternoons. Many stations in the Southwest and the central and southern Great Plains registered 100° temperatures by midweek. The mercury climbed to 101° at Lincoln, Nebr., on the 3d. Temperatures at Roswell, N. Mex., averaged 8° above normal. Maximums at Washington, D. C., averaged 92° in the first 6 days in July. More comfortable weather prevailed over the northern Great Plains where early morning temperatures dropped to the 40's, 50's, and 60's and afternoon maximums remained in the 80's. The temperature regime over the Far West did not change much in the 2d week of July. The Northwest remained cool and comfortable; the Southwest continued hot. A polar High over the Great Lakes brought cool nighttime temperatures to the Northeast with minimums dropping to the 40's on several mornings. Another High stationary off the South Atlantic coast pumped hot humid air across the southern Great Plains that pushed afternoon temperatures into the high 90's and, in some areas, to 100° or higher on 2 or more days. Valentine, Nebr., registered 107° on July 12. Darkness brought only slight relief from the sweltering heat and humidity. Early morning temperatures fell only to the high 70's. The minimum at Kansas City, Mo., was 81° on July 9 and at Memphis, Tenn., 80° on the 10th.

The West warmed in the last half of July. Temperatures reached the 90's along the Canadian border. Stations in eastern Washington registered 90° heat on several afternoons. Interior California stations registered 100° or higher on 1 or more days and the mercury at desert locations soared to 110° or higher. Some of the deserts remained hot at night with temperatures around 90°.

The hot humid weather maintained its grip on the South Central and Southeast in the last half of the month, but in the Northeast hot humid weather alternated erratically with cooler, drier, more comfortable conditions.

The month ended with 100° heat in the Southwest and along the Mexican border. Many stations in the Southwestern Deserts registered 112° to 117° on July 31. More comfortable temperatures occurred along the northern Pacific coast, and from the northern Great Plains to New England. Cooler, less humid air was replacing the sweltering tropical heat in the Deep South.

PRECIPITATION.--Little rain fell west of the Rocky Mountains in July. Most stations in the Far West recorded less than 1 inch, wide areas received less than 1/2 inch, and much of Oregon and California received no rain or only light sprinkles. Some exceptions include parts of Arizona where more than an inch fell. Douglas, Ariz., received more than 4 inches in the 3d week of July and more than 1 inch in the last few days of the month. The July total at Milford, Utah, 1.36 inches, was among the largest July totals in several decades. At Los Angeles, Calif., Civic Center, the July amount, 0.03 inch, was the largest July total in the last half century. This is, of course, the "Dry season" in southern California.

Showers and thunderstorms left an irregular rainfall pattern from the Great Plains to the Atlantic Ocean. Kansas City, Mo., received over 10 inches -- more than twice as much as most localities in the State. Especially heavy rains fell along portions of the Gulf coast -- over 14 inches at Mobile, Ala., and almost 19 inches at Tallahassee, Fla. Washington, D. C., received 9.44 inches and Norfolk, Va., 12.70 inches, both totals being more than twice the 30-year normals. The July total at Atlantic City, N. J., 14.64 inches, is more than 3 times the normal for that location.

Generous showers occurred in central Missouri and from northern Ohio to extreme northern West Virginia in the first week of July. Portions of the latter area received 4 to 11 inches of rain during the week. A 21-county area in northern Ohio received 4 to 11 inches of rain between 6 p.m., July 4 and 11 a.m., July 5. Winds gusting to 100 m.p.h. and severe lightning accompanied the initial line of thunderstorms which extended from Toledo to Conneaut. The winds downed thousands of trees. Runoff from the heavy rains exceeded the capacity of drainage systems and headwater streams, causing rapid flooding of wide areas. The floods damaged thousands of dwellings, over a hundred bridges and culverts, and closed numerous roads and highways. Forty-one persons lost their lives -- most from drowning but several were killed by falling trees. A few were electrocuted by fallen wires and 1 was struck by lightning. The storms injured more than 550 persons and caused many millions of dollars damage to property and crops.

Heavy showers fell from eastern Nebraska to northern Illinois and along the middle Gulf coast in the 3d week of July. Weekly totals ranged up to 5 1/2 inches in south-central Iowa and to about 9 inches in Alabama. Up to 6 inches of rain fell in northeastern Ohio on the forenoon of July 20. Abundant rains fell along the Atlantic seaboard in the last few days of the month. Torrential rains from the 27th to 30th caused flash flooding, road washouts, and soil erosion from Vermont, New Hampshire, and central Maine to the South Carolina Piedmont. Damage was especially severe from Virginia northward to the coastal sections of Maine.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

CLIMATOLOGICAL DATA

METRIC UNITS

State and Station	Elevation (ground)	Pressure: Station	Pressure: Sea level	Temperature: Average maximum	Average minimum	Average	Departure from normal	Highest	Date	Lowest	Date	No. of days: Max 32.2 °C or above	No. of days: Min. 0 °C or lower	Average dew point	Average relative humidity	Precipitation: Total	Departure from normal	Greatest in 24 hours	No. of days: 25 mm or more	No. of days: With thunderstorms	Snow, Sleet: Total	Snow, Sleet: Maximum depth on ground	Wind: Resultant speed	Resultant direction	Fastest mile (1.6 kilometers): Speed	Direction	Date	No. of days (sunrise to sunset): Clear, 0-3	Partly cloudy, 4-7	Cloudy, 8-10	Sky cover, tenths (sunrise to sunset)	Possible sunshine
